Tmax

T GENERATION

Tmax has grown. ABB SACE's experience in designing and manufacturing moulded-case

circuit-breakers has made it possible to create apparatus which, up to 630 A, allows any application to be faced practically and simply. The new Tmax have been thought up to work together, to help you carry out selections and correct sizing, to make installation simpler, but above all to give you top level performances. The latest generation technology is present for the first time even in the smallest sizes, to reach protection releases with integrated dialogue units. With Tmax you have everything you need at hand to make your job easier, from all types of accessories and terminals. The T Generation grows, and so does freedom.

**TMAX.
BE FREE.**

The Tmax T4 and T5 circuit-breakers have obtained the prestigious "INTEL Design 2003 - Augusto Morello award" in the Product Technologies and Production processes section.

WORLD
OF
MUSIC

TECHNOLOGY

**TMAX.
BE FREE TO
RIDE THE MOST
ADVANCED
TECHNOLOGY.**

It was not easy to find solutions which would allow the Tmax circuit-breakers to achieve such high performances in such limited dimensions, but thanks to the experience which has been recognised to a leader such as

ABB SACE for decades, the objectives we had set ourselves have been achieved. So this has meant

being able to equip such a small circuit-breaker as

the T2 with an electronic release, to fit the apparatus with new arcing chambers which allow the arc extinction time to be reduced, or, still further, to provide double insulation for ever greater safety right from the smallest size.

A complete series of latest generation releases is available, from the electronic ones also fitted with an integrated dialogue unit, to the

thermomagnetic, or magnetic only ones - all interchangeable. And residual current releases

up to 630 A, among which the exclusive B type residual current release stands out, sensitive to

continuous fault currents and frequencies up to

1000 Hz. The new Tmax T4 and T5 are an example

of the great technology expressed by this family of

apparatus with high breaking capacity, I_{cs} at 100% of I_{cu} and high limitation of the specific let-through energy.

Being free is also all this.

SIZING

**TMAX.
BE FREE TO
CHOOSE
OPTIMAL SIZING.**

All the apparatus in the Tmax family comes from optimisation of installation sizing. With T1, T2 and T3 you can find the ideal apparatus for sizing an installation up to 250 A, and with T4 and T5 up to 630 A.

Furthermore, with the latter, high selectivity values are obtained for optimal coordination with other apparatus.

You can also choose the best solution for motor protection up to 250 kW at 400 V in alternating current. Higher performances in less space. More applications up to 630 A. Easier selection of the apparatus and accessories. Optimal sizing of the installation and better protection of cables, busbar ducts and supports. Less space required in the switchgear and in the metal structures. Less oversizing and therefore lower costs. Less time for coordinating the installations. Fewer stock complications. With Tmax, all the solutions needed can be chosen, as well as that of feeling freer to choose.

THE GENIUS OF THE DARK

THE GENIUS OF THE DARK

INSTALLATION

**TMAX.
BE FREE TO
DRIBBLE ROUND
ALL INSTALLATION
DIFFICULTIES.**

Having apparatus available with smaller dimensions than all the others on the market undoubtedly offers great advantages - more space for cabling operations and

simpler installation, therefore notable savings in time

- five pieces of apparatus, just two depths - 70 mm for T1, T2, T3 and 103.5 mm for T4 and T5, and the latter also have the same height.

They are also available in all the versions: fixed, plug-in and withdrawable and, thanks to special kits, passing from a fixed circuit-breaker to a plug-in/withdrawable one is child's play.

Flexibility of use over the whole series is ensured by the complete range of connection terminals and by the large number of accessories. Being free also means having much more time for yourself.

General

ABB SACE's Tmax moulded-case circuit-breakers come in five sizes: T1, T2, T3, T4 and T5, able to cover a range of service currents from 1 to 630 A. All the circuit-breakers, both three-pole and four-pole, are available in the fixed version; the sizes T2, T3, T4 and T5 in the plug-in version and T4 and T5 in the withdrawable one as well.

With the same overall dimensions, the circuit-breakers in the Tmax family, are available with different breaking capacities at 380/415 V, indicated by the following letters:

- B** 16 kA
- C** 25 kA
- N** 36 kA
- S** 50 kA
- H** 70 kA
- L** 85 kA (for T2) or 120 kA (for T4 and T5)
- V** 200 kA

1SDC210227F0004

The electric arc interruption system used on the Tmax circuit-breakers allows the short-circuit currents of very high value to be interrupted extremely rapidly. The considerable opening speed of the contacts, the dynamic blasting action carried out by the magnetic field and the structure of the arcing chamber contribute to extinguishing the arc in the shortest possible time, notably limiting the value of the specific let-through energy I^2t and the current peak.

Construction characteristics

Modularity of the series

1

Starting from the fixed version circuit-breaker, all the other versions used for various requirements are obtained by means of mounting conversion kits.

The following are available:

- kit for converting a fixed circuit-breaker into the moving part of a plug-in and withdrawable one
- circuit-breaker fixed parts for plug-in and withdrawable circuit-breakers
- conversion kit for the connection terminals.

Various accessories are also available:

1. Breaking unit
2. Trip units
3. Front
4. Auxiliary contacts - AUX and AUX-E
5. Undervoltage release - UVR
6. Shunt opening release - SOR
7. Terminal covers
8. Front for lever operating mechanism - FLD
9. Direct rotary handle - RHD
10. Stored energy motor operator - MOE
11. Key lock - KLF
12. Early auxiliary contact - AUE
13. Transmitted rotary handle - RHE
14. Front terminal for copper cable - FC Cu
15. Front extended terminal - EF
16. Multi-cable terminal (only for T4) - MC
17. Front terminal for copper-aluminium - FC CuAl
18. Front extended spread terminal - ES
19. Rear orientated terminal - R
20. Conversion kit for plug-in/withdrawable versions
21. Guide of fixed part in the withdrawable version
22. Fixed part - FP
23. Auxiliary position contact - AUP
24. Phase separators
25. PR010T
26. TT1
27. Racking out crank handle
28. Residual current release.

Construction characteristics

Distinguishing features of the series

1

Double insulation

Tmax has double insulation between the live power parts (excluding the terminals) and the front parts of the apparatus where the operator works during normal operation of the installation. The seat of each electrical accessory is completely segregated from the power circuit, thereby preventing any risk of contact with live parts, and, in particular, the operating mechanism unit is completely insulated in relation to the powered circuits.

Furthermore, the circuit-breaker has oversized insulation, both between the live internal parts and in the area of the connection terminals.

In fact, the distances exceed those required by the IEC Standards and comply with what is foreseen in American usage (UL 489 Standard).

15DC210106F0004

Positive operation

The operating lever always indicates the precise position of the moving contacts of the circuit-breaker, thereby guaranteeing safe and reliable signals, in compliance with the prescriptions of the IEC 60073 and IEC 60417-2 Standard (I = Closed; O = Open; yellow-green line = Open due to release trip). The circuit-breaker operating mechanism has free release regardless of the pressure on the lever and the speed of the operation. Release tripping automatically opens the moving contacts: to close them again, the operating mechanism must be reset by pushing the operating lever from the intermediate position into the lowest open position.

15DC210106F0004

Isolation behaviour

In the open position, the circuit-breaker guarantees circuit isolation in compliance with the IEC 60947-2 Standard. The oversized insulation distances guarantee there are no leakage currents and dielectric resistance to any overvoltages between input and output. For the plug-in or withdrawable version circuit-breakers, in the racked-out or withdrawn position, the power and auxiliary circuits are insulated, guaranteeing that no part is live. By means of special sockets - plug, it is possible to carry out blank tests under these conditions, operating the circuit-breaker in complete safety.

1SDC210184F0004

1SDC210110F0004

Degrees of protection

The table indicates the degrees of protection guaranteed by the Tmax circuit-breakers according to the prescriptions of the IEC 60529 Standard:

	With front	Without front ⁽²⁾	Without terminal covers	With high terminal covers	With low terminal covers	With IP40 protection kit on the front
A	IP 40 ⁽³⁾	IP 20	-	-	-	-
B	IP 20	IP 20	IP 20	IP 40	IP 40	IP 40
C	-	-	-	IP 40 ⁽¹⁾	IP 30 ⁽¹⁾	-

⁽¹⁾ After correct installation ⁽²⁾ During installation of the electrical accessories ⁽³⁾ Also for front for lever operating mechanism and direct rotary handle

The fixed parts are always preset with IP 20 degree of protection. IP 54 degree of protection can be obtained with the circuit-breaker installed in a switchboard fitted with a rotary handle operating mechanism transmitted on the compartment door and special kit (RHE – IP54).

Construction characteristics

Distinguishing features of the series

1

Operating temperature

The Tmax circuit-breakers can be used in ambient conditions where the surrounding air temperature varies between -25 °C and +70 °C, and stored in ambients with temperatures between -40 °C and +70 °C.

The circuit-breakers fitted with thermomagnetic release have their thermal element set for a reference temperature of +40 °C.

For temperatures other than +40 °C, with the same setting, there is a thermal trip threshold variation as shown in the table on page 4/46 and following.

The electronic overcurrent releases do not undergo any variations in performance as the temperature varies but, in the case of temperatures exceeding +40 °C, the maximum setting for protection against overloads L must be reduced, as indicated in the derating graph on page 4/40 and following, to take into account the heating phenomena which occur in the copper parts of the circuit-breaker passed through by the phase current.

For temperatures above +70 °C the circuit-breaker perform-

ances are not guaranteed.

To ensure service continuity of the installations, the way to keep the temperature within acceptable levels for operation of the various devices and not only of the circuit-breakers must be carefully assessed, such as using forced ventilation in the switchboards and in their installation room.

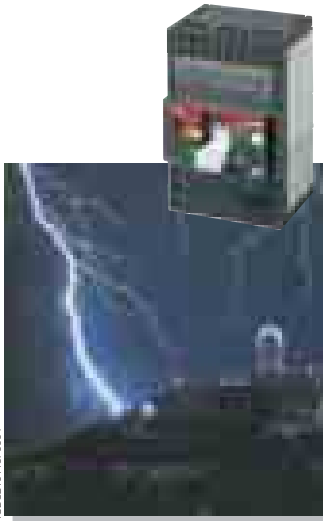

1SBC210111F004

Altitude

Up to an altitude of 2000 m the Tmax circuit-breakers do not undergo any alterations in their rated performances.

As the altitude increases, the atmospheric properties are altered in terms of composition, dielectric resistance, cooling capacity and pressure. The circuit-breaker performances therefore undergo derating, which can basically be measured by means of the variation in significant parameters such as the maximum rated operating voltage and the rated uninterrupted current.

Altitude	[m]	2000	3000	4000	5000
Rated service voltage, Ue	[V-]	690	600	500	440
Rated uninterrupted current, Iu	%Iu	100	98	93	90

1SD210115F0004

Electromagnetic compatibility

Operation of the protections is guaranteed in the presence of interferences caused by electronic apparatus, atmospheric disturbances or electrical discharges by using the electronic releases and the electronic residual current releases. No interference with other electronic apparatus near the place of installation is generated either. This is in compliance with the IEC 60947-2 Appendix F Standards and European Directive No. 89/336 regarding EMC - electromagnetic compatibility.

Tropicalisation

Circuit-breakers and accessories in the Tmax series are tested in compliance with the IEC 60068-2-30 Standard, carrying out 2 cycles at 55 °C with the "variant 1" method (clause 6.3.3). The suitability of the Tmax series for use under the most severe environmental conditions is therefore ensured with the hot-humid climate defined in the climatograph 8 of the IEC 60721-2-1 Standards thanks to:

- moulded insulating cases made of synthetic resins reinforced with glass fibres;
- anti-corrosion treatment of the main metallic parts;
- Fe/Zn 12 galvanisation (ISO 2081), protected by a conversion layer mainly consisting of chromates (ISO 4520);
- application of anti-condensation protection for electronic overcurrent releases and relative accessories.

1SD210115F0004

Resistance to shocks and vibrations

The circuit-breakers are unaffected by vibrations generated mechanically and due to electromagnetic effects, in compliance with the IEC 60068-2-6 Standards and the regulations of the major classification organisations:

- RINA
- Det Norske Veritas
- Bureau Veritas
- Lloyd's register of shipping
- Germanischer Lloyd
- ABS
- Russian Maritime Register of Shipping.

The Tmax circuit-breakers are also tested, according to the IEC 60068-2-27 Standard, to resist shocks up to 12g for 11 ms. Please ask ABB SACE for higher performances in terms of resistance to shocks.

Construction characteristics

Distinguishing features of the series

1

Installation

Tmax circuit-breakers can be installed in the switchboards, mounted in any horizontal, vertical or lying down position on the back plate or on rails, without undergoing any derating of their rated characteristics. Tmax circuit-breakers can be installed easily in all types of switchboards, above all thanks to the possibility of being supplied either by top or bottom terminals, without jeopardising the apparatus functionality.

Apart from fixing on the base plate, T1, T2 and T3 can also be installed on DIN 50022 rails, thanks to the special fixing brackets.

Furthermore, the depth of 70 mm, takes Tmax T3 to the same standard as the two smaller sizes, making assembly of circuit-breakers up to 250 A in standard switchboards even simpler. In fact, it is possible to prepare standardised support structures, facilitating the design stage and construction of the switchboard metalwork.

Racking-out with the door closed

With Tmax T4 and T5 circuit-breakers, in the withdrawable version, the circuit-breaker can be racked-in and out with the compartment door closed, thereby increasing operator safety and allowing rationalisation of low voltage arc proof switchboards. Racking out can only be carried out with the circuit-breaker open (for obvious safety reasons), using a special racking-out crank supplied with the conversion kit from fixed circuit-breaker to moving part of withdrawable circuit-breaker.

Range of accessories

The completeness and installation rationality of the Tmax series is also achieved thanks to innovative solutions in development of the accessories:

- single range of accessories for T1, T2 and T3 and one for T4 and T5, characterised by completeness and simplicity for installation in switchboards. Harmonisation of the accessories allows reduction in stocks and greater service flexibility, offering increasing advantages for users of the Tmax series;
- same possibility of equipping with accessories, in terms of connection devices (terminals, terminal covers and phase separators), between fixed circuit-breakers and fixed parts of plug-in circuit-breakers for Tmax T2 and T3;
- wide offer of residual current releases:
 - three-pole and four-pole RC221 and RC222 up to 250 A with T1, T2 and T3;
 - RC222 underneath, four-pole up to 500 A with T4 and T5;
 - RC223 (type B), also sensitive to currents with continuous components, four-pole for T3 and T4;
 - four-pole RC222 in plug-in version for T4 and T5.

Construction characteristics

Distinguishing features of the series

Compliance with Standards and company quality system

Tmax circuit-breakers and their accessories comply with the international IEC 60947-2 Standards and the EC directive:

- Low Voltage Directives (LVD) no. 73/23 EEC
 - Electromagnetic Compatibility Directive (EMC) no. 89/336 EEC.
- Certification of compliance with the product Standards mentioned above is carried out, in accordance with the European EN 45011 Standard, by the Italian certification organisation ACAE (Association for Certification of Electrical Apparatus), member of the European organization LOVAG (Low Voltage Agreement Group) and by the Swedish certification organization SEMKO.

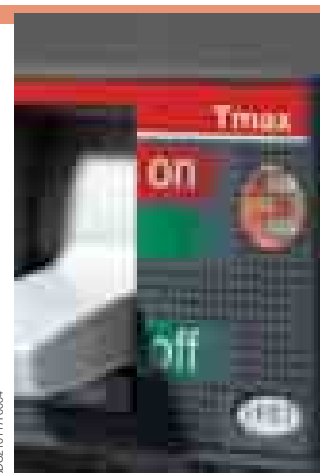

The Test Room at ABB SACE is accredited by SINAL (certificate No. 062). The Tmax series also has a range which has undergone certification according to the severe American UL 489 and CSA C22.2 Standards. Furthermore, the Tmax series is certified by the Russian GOST (Russia Certificate of Conformity) certification organisation. The pieces of apparatus comply with the prescriptions for on-board shipping installations and are approved by the major Naval Registers - Lloyd's Register of Shipping, Germanischer Lloyd, Bureau Veritas, Rina, Det Norske Veritas, Russian Maritime Register of Shipping, and ABS (please ask ABB SACE for confirmation about the versions available).

ABB SACE's Quality System complies with the international ISO 9001-2000 Standard (model for quality assurance in design, development, construction, installation and service assistance) and with the equivalent European EN ISO 9001 and Italian UNI EN ISO 9001 Standards.

The third certifying Organisation is RINA-QUACER. ABB SACE obtained its first certification in 1990.

The new Tmax series has a hologram on the front, obtained using special anti-imitation techniques - a guarantee of the quality and genuineness of the circuit-breaker as an ABB SACE product. Attention to protection of the environment is another priority commitment for ABB SACE, and, as confirmation of this, the environmental management system has been certified by RINA. ABB SACE - the first industry in the electromechanical sector in Italy to obtain this recognition - thanks to a revision of the production process with an eye to ecology - has been able to reduce the consumption of raw materials and waste from processing by 20%. ABB SACE's commitment to safeguarding the environment is also shown in a concrete way by Life Cycle Assessments (LCA) of the products, carried out directly by ABB SACE's Research and Development in collaboration with the ABB Research Centre. Selection of materials, processes and packing materials is made optimising the true environmental impact of the product, also foreseeing the possibility of its being recycled.

Furthermore, in 1997 ABB SACE developed its Environmental Management system and got it certified in conformity with the international ISO14001 Standard, integrating it in 1999 with the Management System for Health and Safety in the workplace according to OHSAS 18001 (Swedish National Testing and Research Institute).

F = Fixed circuit-breakers
P = Plug-in circuit-breakers

W = Withdrawable circuit-breakers

(*) The breaking capacity for settings In=16 A and In= 20 A is 16 kA

(1) 75% for T5 630

(2) 50% for T5 630

(3) Icw = 5 kA

Notes: in the plug-in version of T2, T3 and T5, and in the withdrawable version of T5 the maximum setting is derated by 10% at 40 °C.

Circuit-breakers for power distribution

General characteristics

General characteristics

The new series of Tmax moulded-case circuit-breakers - complying with the IEC 60947-2 Standard - is divided into five basic sizes, with an application range from 1 A to 630 A and breaking capacities from 16 kA to 200 kA (at 380/415 V AC).

Selection of the size allows the basic electrical characteristics to be identified simply and immediately, whereas selection of the overcurrent release is made according to the type of application required.

Furthermore, for the first time ABB SACE has also developed a moulded-case circuit-breaker with a single-pole construction characteristic: T1B 1p. This is a 160 A rated uninterrupted current circuit-breaker, able to operate at service voltages up to 240 V AC and 125 V DC, complying with the IEC 60947-2 Standard. From the viewpoint of dimensions, the new T1B 1p is absolutely identical to the Tmax T1 size (same height H = 130 mm and same depth D = 70 mm), except for the width, typical of a single pole (L = 25.4 mm). It is therefore suitable for being installed in distribution switchboards by means of a back plate, even side by side with other circuit-breakers in the series.

For protection of alternating current networks, the following are available:

- T1B 1p circuit-breaker, equipped with TMF thermomagnetic releases with fixed thermal and magnetic threshold ($I_3 = 10 \times I_n$);
- T1, T2, T3 and T4 (up to 50 A) circuit-breakers equipped with TMD thermomagnetic releases with adjustable thermal threshold ($I_1 = 0.7 \dots 1 \times I_n$) and fixed magnetic threshold ($I_3 = 10 \times I_n$);
- T3 and T5 circuit-breakers, fitted with TMG releases for generator protection with adjustable thermal threshold ($I_1 = 0.7 \dots 1 \times I_n$) and fixed magnetic threshold ($I_3 = 3 \times I_n$) for T3 and adjustable magnetic threshold ($I_3 = 2.5 \dots 5 \times I_n$) for T5;
- T4 and T5 circuit-breakers with TMA thermomagnetic releases with adjustable thermal threshold ($I_1 = 0.7 \dots 1 \times I_n$) and adjustable magnetic threshold ($I_3 = 5 \dots 10 \times I_n$).
- T2 with PR221DS electronic release;
- T4 and T5 with PR221DS, PR222DS/P and PR222DS/PD electronic releases.

The field of application in alternating current of the Tmax series varies from 1 A to 630 A with voltages up to 690 V.

The Tmax T1, T2, T3, T4 and T5 circuit-breakers equipped with TMD and TMA can also be used in direct current plants, with a range of application from 1 A to 500 A and a minimum operating voltage of 24 V DC. With two poles in series, T1, T2, T3 can be used with rated voltages of 250 V and T4, T5 with 500 V with breaking capacities up to 100 kA, whereas with 3 poles in series 500 V for T1, T2, T3 and 750 V for T4, T5 can be reached with breaking capacities still up to 100 kA for T1, T2, T3 and 70 kA for T4, T5.

Interchangeability

The Tmax T4 and T5 circuit-breakers can be equipped either with TMD, TMG or TMA thermomagnetic releases, MA

magnetic only releases or PR221DS, PR222DS/P, PR222DS/PD and PR222MP electronic releases. Thanks to

their simplicity of assembly, the end customer can, in fact, change the type of release extremely rapidly, according to

Circuit-breakers for power distribution

Thermomagnetic releases

Thermomagnetic releases

The Tmax T1 1p, T1, T2, T3, T4 and T5 circuit-breakers can be fitted with thermomagnetic releases and are used in protection of alternating and direct current networks with a range of use from 1,6 A to 500 A. They allow the protection against overload with a thermal device (with fixed threshold for T1 1p and adjustable threshold for T1, T2, T3, T4 and T5) realised using the bimetal technique, and protection against short-circuit with a magnetic device (with fixed threshold for T1, T2 and T3 and T4 up to 50 A and adjustable threshold for T4 and T5).

The four-pole circuit-breakers are always supplied with the neutral protected by the release and with protection of the neutral at 100% of the phase setting for settings up to 100 A. For higher settings, the protection of the neutral is at 50% of the phase setting unless the protection of the neutral at 100% of I_n is required.

Furthermore, for Tmax T3 and T5, the TMG thermomagnetic releases for generator protection are available. For T3 the release has adjustable thermal threshold ($I_1 = 0.7...1 \times I_n$) and fixed magnetic threshold ($I_3 = 3 \times I_n$), whereas for T5 the release has adjustable thermal threshold ($I_1 = 0.7...1 \times I_n$) and adjustable magnetic threshold ($I_3 = 2.5... 5 \times I_n$).

2

Thermomagnetic release TMD and TMG (for T3)

Thermal threshold

Adjustable from 0.7 to $1 \times I_n$

1SD0210313R0004

Thermal threshold

Adjustable from 0.7 to $1 \times I_n$

1SD0210314R0004

TMD = thermomagnetic release with adjustable thermal threshold ($I_1 = 0.7...1 \times I_n$) and magnetic fixed threshold.
TMG (for T3) = thermomagnetic release for generator protection with adjustable thermal threshold ($I_1 = 0.7...1 \times I_n$) and fixed magnetic threshold

Notes: ⁽¹⁾ only T1B ⁽²⁾ only T1B and T1C

- I_n identifies the setting current for protection of the phases (L1, L2 and L3) and of the neutral.
- The TMD and TMA thermomagnetic releases have the thermal element with adjustable threshold $I_1 = 0.7 \dots 1 \times I_n$. The value of the thermal element adjustment which is obtained by acting on the special selector, is intended at 40 °C. The magnetic element has fixed trip threshold with $\pm 20\%$ tolerance according to what is indicated by the IEC 60947-2 (pos. 8.3.3.1.2) Standard. The trip thresholds of the magnetic protection I_3 are a function of the setting used both by the phase and neutral protection.

Notes:

- I_n identifies the setting current for protection of the phases (L1, L2 and L3) and of the neutral.
- The TMA and TMG thermomagnetic releases which equip the Tmax T4 and T5 circuit-breakers have the thermal element with adjustable threshold $I_t = 0.7...1 \times I_n$. The set current value which is obtained using the special selector is intended at 40°C. The magnetic element has adjustable trip threshold ($I_s = 5...10 \times I_n$ for TMA and $I_s = 2.5...5 \times I_n$ for TMG) with a tolerance of $\pm 20\%$ according to what is indicated in the Norma IEC 60947-2 (pos. 8.3.3.1.2) Standard.

Circuit-breakers for power distribution

Electronic releases

General characteristics

The Tmax T2, T4 and T5 circuit-breakers for uses in alternating current can be equipped with PR221DS, PR222DS/P and PR222DS/PD overcurrent releases constructed using electronic technology. This allows protection functions to be obtained which guarantee great reliability, trip precision and immunity to electromagnetic components in compliance with the standards on the matter. The power supply required for correct operation is supplied directly by the release current transformers and tripping is always guaranteed, even under single-phase load conditions and in correspondence with the minimum setting.

The protection releases are made up of the current transformers (three or four depending on the number of conductors to be protected), the PR221DS, PR222DS/P or PR222DS/PD protection unit and of a trip coil with demagnetisation which acts directly on the circuit-breaker operating mechanism unit and is mounted in the right-hand slot of the circuit-breaker for Tmax T2 or is already housed in the release box for Tmax T4 and T5.

The current transformers are housed inside the release box and supply the energy required for correct operation of the protection and the signal needed to detect the current. They are available with primary rated current as indicated in the table.

When the protection trips, the circuit-breaker opens by means of the trip coil, which changes over a contact (AUX-SA, supplied on request) to signal release tripped. Signalling reset is of mechanical type and takes place with resetting of the circuit-breaker operating lever.

The test of the trip coil can be carried out by means of the SACE TT1 test device. Positive outcome of the test coincides with circuit-breaker opening.

Characteristics of the electronic releases - PR221DS, PR222DS/P and PR222DS/PD

Operating temperature	-25 °C ... +70 °C
Relative humidity	90%
Operating frequency	45...66 Hz

Circuit-breakers for power distribution

Electronic releases

PR221DS

The PR221DS release, available for T2, T4 and T5, provides protection functions against overload L and short-circuit S/I (version PR221DS-LS/I); with this version, you can choose between protection S or I moving the dip-switch. Alternatively, the version with only the function of protection against instantaneous short-circuit I is available (version PR221DS-I, also see page 2/23).

The wide range of settings makes this release particularly suitable in all distribution applications where reliability and trip precision are required and where only protection against short-circuit ($I_s = 1 \dots 10 \times I_n$) is needed, this obtained using the PR221DS release in version I.

The PR221DS release for Tmax T2 has some differences compared with the one which can be used with T4 and T5. With Tmax T2, the release is not interchangeable, protection against overload L can be

set manually at $I_1 = 0.4 \dots 1 \times I_n$ with 16 thresholds by means of a dip switch on the front of the circuit-breaker, and it is possible to select between 2 trip curves 3s at $6 \times I_1$ and 6s at $6 \times I_1$.

On the other hand, with Tmax T4 and T5, protection L can be set manually at $I_1 = 0.4 \dots 1 \times I_n$ with 16 thresholds by means of a dip switch on the front of the circuit-breaker and it is possible to select between 2 different

trip curves 3s at $6 \times I_1$ and 12s at $6 \times I_1$. The protection functions against delayed short-circuit S or, alternatively, instantaneous I are the same both for the PR221DS of Tmax T2 and for T4 and T5.

Example of protection setting

Given a T2 160 circuit-breaker with $I_n = 100$ A, set the protection L to $I_1 = 80$ A in curve 3s, and S to 300 A in curve 0.25s:

To obtain $I_1 = 80$ A, the dip switches in correspondence with 0.08 and 0.32 must be moved so that $I_1 = I_n \times (0.4 + 0.32 + 0.08) = 100 \times (0.4 + 0.32 + 0.08) = 80$ A. To select curve 3s, the dip switch in correspondence with t1 must be moved upwards.

To obtain $I_2 = 300$ A, first of all, the dip must be moved in correspondence of "S" protection, then the dip switches in correspondence with 1 and 2 must be moved so that $I_2 = I_n \times (1 + 2) = 100 \times (1 + 2) = 300$ A.

To select curve 0,25s, the dip switch in correspondence with t2 must be moved downwards.

PR221DS-LS/I

Protection S

Against short-circuit with delayed trip

Protection L

Against overload

Dip-switches for setting the neutral (only for T4 and T5)

Socket for TT1 test unit

Protection I

Against short-circuit with instantaneous trip

1SD2210187F0004

The protection function against short-circuit with delayed trip S, with inverse short time delay with inverse time characteristic ($I^2t = \text{const}$) can be set, $I_2 = 1 \dots 10 \times I_n$ with 15 thresholds, and the possibility of excluding the protection, which can be set by means of the dip switches on the front of the circuit-breaker. The protection time delay can be selected by adjusting the dip switches on one of the two available curves (0.1s at $8 \times I_n$, 0.25s at $8 \times I_n$).

The protection function against instantaneous short-circuit I can be adjusted to $I_3 = 1 \dots 10 \times I_n$ with 15 thresholds and the possibility of excluding the protection, which can be set by means of the specific dip switch.

There is a single adjustment for the phases and the neutral. However, for these it can be decided whether to request the protection threshold of the functions at 50 - 100% of that of the phases for Tmax T2 ($I_n = 100 \text{ A}$), whereas for T4 and T5 it is possible to select the protection threshold OFF, 50% or 100% directly from the front of the release by means of the specific dip switch.

The trip coil is always supplied with the PR221DS release for Tmax T2 and is housed in the right-hand slot of the circuit-breaker. These are available by ordering kits of auxiliary contacts specifically for T2 with electronic release (see page 3/18).

On the other hand, for Tmax T4 and T5, the trip coil is housed inside the electronic release and therefore, since the right slot of the circuit-breaker is not occupied, the auxiliary contacts available can be used. The auxiliary contacts AUX-SA to signal release trip can always be used (see page 3/18).

⁽¹⁾ For T4 $I_n = 320 \text{ A}$ and T5 $I_n = 630 \text{ A} \Rightarrow I_{2,\text{max}} = 8.5 \times I_n$

Circuit-breakers for power distribution

Electronic releases

PR222DS/P

The PR222DS/P release, available for T4 and T5, has protection functions against overload L, delayed S and instantaneous I short-circuit (version PR222DS/P-LSI) and, alternatively, as well as the functions L, S, I, also has protection against earth fault G (version PR222DS/P-LSIG).

The wide range of adjustments makes this release particularly suitable in all distribution applications where reliability and trip precision are required.

Function L, which cannot be excluded, can be set manually to $I_1 = 0.4 \dots 1 \times I_n$ with 32 thresholds which can be set by means of the dip switches on the front of the release, or electronically by means of the SACE PR010T test and configuration unit which can be set between $I_1 = 0.4 \dots 1 \times I_n$ with 61 thresholds (steps of $0.01 \times I_n$). Furthermore, it is possible to select among four different trip curves: 3s at $6 \times I_1$, 6s at $6 \times I_1$, 9s at $6 \times I_1$, 12s at $6 \times I_n$ for T4 $I_n = 320 \text{ A}$ and T5 $I_n = 630 \text{ A}$ and 18s at $6 \times I_1$ for all the other settings.

Otherwise it is also possible to set the trip time to $6 \times I_1$ electronically between 3 and 18s with 31 thresholds (step of 0.5s), except for T4 $I_n = 320 \text{ A}$ and T5 $I_n = 630 \text{ A}$, for which the maximum value is 12s.

The function of protection against short-circuit with delayed trip S, with inverse short delay with characteristic with inverse time ($I^2t = \text{const}$) or with definite time, can be set to $I_2 = 0.6 \dots 10 \times I_n$ with 15 thresholds and the possibility of excluding the protection, which can be set by means of the dip switches on the front of the circuit-breaker, or with the SACE PR010T $I_2 = 0.6 \dots 10 \times I_n$ with 95 thresholds (steps of 0.1). The time delay of the protection can be selected either manually by adjusting the dip switch to one of the four curves available (with delay of 0.05s at $8 \times I_n$, 0.1s at $8 \times I_n$, 0.25s at $8 \times I_n$ or 0.5s at $8 \times I_n$) or electronically by means of PR010T between 0.05 and 0.5s at $8 \times I_n$ with 46 thresholds (steps of 0.01s). The function of protection against instantaneous short-circuit I is adjustable to $I_3^{(1)} = 1.5 \dots 12 \times I_n$ with 15 thresholds and the possibility of excluding the protection, can be set by means of dip switches, or with the SACE PR010T at $I_3^{(1)} = 1.5 \dots 12 \times I_n$ with 86 thresholds (steps of $0.1 \times I_n$).

The function of protection against earth fault G is adjustable either manually, by means of dip switches, to $I_4 = 0.2 \dots 1 \times I_n$ with 7 thresholds and the possibility of excluding the protection, or elec-

tronically by means of the SACE PR010T to $I_4 = 0.2 \dots 1 \times I_n$ with 81 thresholds (steps of $0.01 \times I_n$). It is also possible to select among four different trip curves: 0.1s at $3.15 \times I_4$, 0.2s at $2.25 \times I_4$, 0.4s at $1.6 \times I_4$ and 0.8s at $1.10 \times I_4$, or to set the trip time electronically between 0.1 and 0.8s with 71 thresholds (steps of 0.01s).

There is a single setting for the phases and neutral, for which one can decide whether to set the threshold of the protection functions to OFF, to 50% or to 100% that of the phases by means of two special dip switches on the front of the circuit-breaker.

Furthermore, on the front of the PR222DS/P (or PD) releases, signalling of pre-alarm and alarm of protection L is available. The pre-alarm threshold value (cannot be excluded or modified by the user) is equal to $0.9 \times I_1$. It is also possible to transmit remotely the alarm of protection L, simply connecting connector X3 to the dedicated contact.

⁽¹⁾ For T4 $I_n = 320 \text{ A}$ and T5 $I_n = 630 \text{ A} \Rightarrow I_{3\text{max}} = 10 \times I_n$

PR222DS/PD

Apart from the protection functions against overload L, delayed S and instantaneous I short-circuit (version PR222DS/PD-LSI) or, alternatively, plus the

extra protection against earth fault G (version PR222DS/PD-LSIG), the PR222DS/PD release, available for T4 and T5, also has the dialogue unit integrated with Modbus® RTU protocol.

The Modbus® RTU protocol has been known and used worldwide for many years and is now a market standard thanks to its simplicity of installation, configuration and to its integration in the various different supervision, control and automation systems, as well as good level performances.

The PR222/PD releases allow the Tmax T4 and T5 circuit-breakers to be integrated in a communication network based on the Modbus® RTU protocol. Modbus® RTU provides a Master-Slave system architecture where a Master (PLC, PC...) cyclically interrogates several Slaves (field devices). The devices use the EIA RS485 standard as the physical means for data transmission at a maximum transmission speed of 19200 bit/sec.

Again for this release, the power supply needed for correct operation of the protection functions is supplied directly by the current transformers of the release, and tripping is always guaranteed, even under conditions of single-phase load and in correspondence with the minimum setting. Nevertheless, communication is only possible with an auxiliary power supply of 24 V DC.

The PR222DS/PD release, with integrated communication and

control functions, allows a wide range of information to be acquired and transmitted remotely, to carry out opening and closing commands thanks to shunt opening and closing releases installed on board the circuit-breaker, to store the configuration parameters and those for programming the unit itself like the current thresholds of the protection functions and the protection curves.

All the information can be consulted both locally, directly on the front of the circuit-breaker with the front display unit FDU, and remotely by means of supervision and control systems. The PR222DS/PD releases can be associated with the AUX-E auxiliary contacts in electronic version, to know the state of the circuit-breaker (open/closed), and with AUX-E plus MOE-E motor operator (the AUX-E are compulsory when MOE-E is to be used) to remotely control circuit-breaker opening and closing as well (also see page 3/17 and following).

If the circuit-breaker fitted with the PR222DS/PD release is inserted in a supervision system, during the test phases with the PR010/T unit, communication is automatically abandoned and starts again on completion of this operation.

Communication towards the display unit FDU is also available, which can also take place with self-supply starting from 0.35 x In present at least on one phase.

The details of the functions available are indicated in the diagram.

Circuit-breakers for motor protection

Protection against short-circuit

2

Protection against short-circuit

General characteristics

Starting, switching and protection of three-phase asynchronous motors are basic operations for their correct use.

ABB SACE proposes two different solutions for this type of application:

- a **traditional system**, which foresees a circuit-breaker for protection against short-circuit, a thermal relay for protection against overload and missing or unbalanced phase and a contactor for motor switching;
- a **system of integrated protection** thanks to the PR222MP release, which ensures both protection against short-circuit, and against overload, as well as that against missing or unbalanced phase and that against the rotor block.

All this must necessarily take into account the problems which arise at the moment of starting.

In particular, when selecting these devices, different factors must be taken into consideration, such as:

- the motor power
- the diagram and type of starting
- the type of motor: with cage rotor or with wound rotor
- the fault current at the point of the network where the motor is installed.

Integrated protection

Protection against short-circuit

Magnetic only and electronic overcurrent releases

With the new series of Tmax moulded-case circuit-breakers, ABB SACE proposes a range up to 400 A, which implementing exclusively the protection against short-circuit, is suitable for use inside protected starters of traditional type.

The Tmax T2, T3 and T4 circuit-breakers in the three-pole version with fixed magnetic only release (only for T2, $I_s = 13 \times I_n$ up to $I_n = 12.5$ A) or adjustable between 6 and 12 times the rated service current for T2 and T3, and between 6 and 14 times for T4, stand out for their compactness and exceptional performances in terms of breaking capacity and limitation of the specific let-through energy. Furthermore, thanks to the great flexibility given by the wide range of magnetic threshold settings, they allow optimal motor protection.

MF - Fixed magnetic only releases

Tmax T2

 $I_3 = 13 \times I_n$	I_n [A]	1	1.6	2	2.5	3.2	4	5	6.5	8.5	11	12.5
	$I_3 = 13 \times I_n$	13	21	26	33	42	52	65	84	110	145	163

Note

The magnetic only releases which equip the Tmax T2 in three-pole version circuit-breaker have a trip threshold I_3 fixed at 13 x I_n , according to what is indicated in the table.

MA - Adjustable magnetic only releases

Tmax T2-T3-T4

 $I_3 = 6...12 \times I_n$ $I_3 = 6...14 \times I_n$	I_n [A]	10	20	25	32	52	80	100	125	160	200	
	Tmax T2		■		■	■	■	■				
	Tmax T3								■	■	■	■
	Tmax T4	■		■		■	■	■	■	■	■	
	Tmax T2, T3 $I_3 = 6...12 \times I_n$	-	120...240	-	192...384	314...624	480...960	600...1200	750...1500	960...1920	1200...2400	
	Tmax T4 $I_3 = 6...14 \times I_n$	60...140	-	150...350	-	314...728	480...1120	600...1400	750...1750	960...2240	1200...2800	

Note

The magnetic only releases which equip the Tmax T2 and T3 three-pole version circuit-breakers have a trip threshold I_3 which can be adjusted from 6 to 12 x I_n for T2 and T3 and from 6 to 14 x I_n for T4, according to what is indicated in the table.

They can be used in a wide range of start-ups, from 0.37 kW to 45 kW for T2 and up to 250 kW for T5 (at 400 V). Finally, T2, T4 and T5 with different levels of breaking capacity in the three-pole and four-pole versions, fitted with the PR221DS-I electronic release,

Characteristics

I_n [A]	10	25	63	100	160	250	320	400	630

Circuit-breakers for motor protection

Integrated protection: PR222MP

Integrated protection

PR222MP electronic overcurrent releases

In the three-pole version, the Tmax T4 and T5 circuit-breakers are fitted with PR222MP electronic releases. This makes it possible to obtain functions which guarantee high trip precision, extreme reliability and immunity to variations in the external temperature.

The PR222MP releases fully integrated on board the circuit-breaker guarantee complete protection of the motor. In fact, it is not necessary to provide the help of an external thermal relay for protection against overloads as, on the other hand, occurs with the standard solution.

The PR222MP can be connected to a contactor for the basic protection function (NORMAL mode) of the motor: the circuit-breaker can control contactor opening in the case of a fault (excluding short-circuit), by means of the SACE PR212/CI

accessory control unit. In fact, a contactor has breaking capacities at high currents which are less efficient than the circuit-breaker, but a high number of possible operations consistently higher than those of the circuit-breaker (about 1.000.000). The combination of the two devices therefore optimises motor protection and control.

However, the PR222MP can also be connected directly to the motor (HEAVY mode). In this case, the circuit-breaker is called on to protect the plant in any case, without the help of the contactor: this solution is suggested for motors with a low number of operations.

2

Characteristics of the SACE PR222MP electronic release

Operating temperature	-25 °C ... +70 °C
Relative humidity	90%
Operating frequency	45...66 Hz
Electromagnetic compatibility (LF and HF)	IEC 60947-2 Annex F

PR222MP - Electronic overcurrent releases

Tmax T4-T5

	In [A]	100	160	200	320	400

T5 400 N, S, L					■	■
 I₁ [A]		40...100	64...160	80...200	128...320	160...400
 I₅ [A]		3...10 x I ₁				
 I₃ [A]		600...1300	960...2080	1200...2600	1920...4160	2400...5200
 I₆ [A]		0.4 x I ₁				

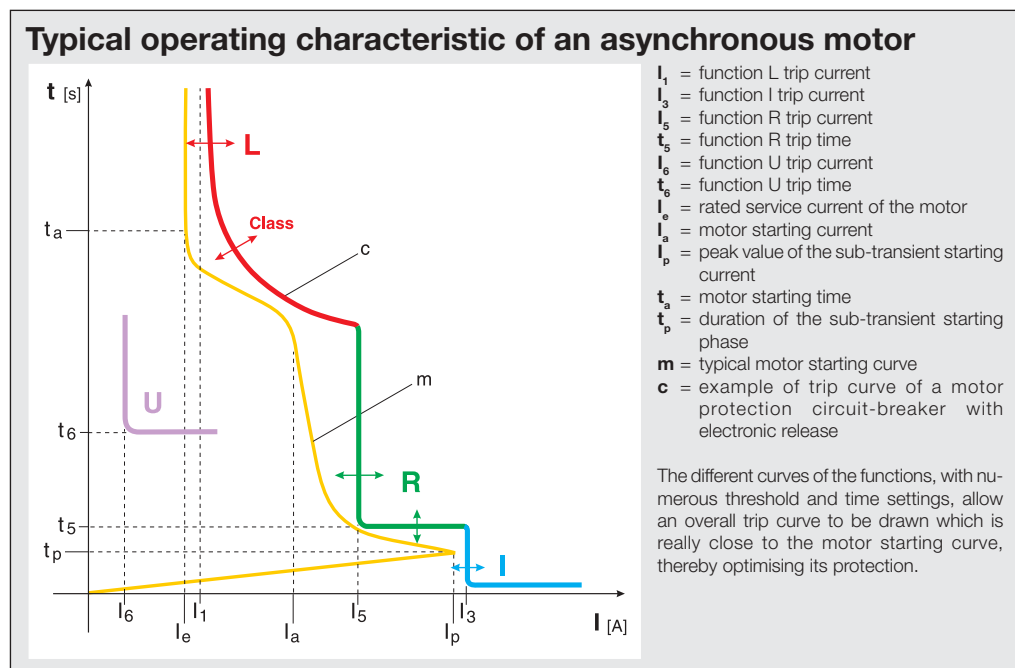

In any case, the PR010/T unit for testing the release and checking the protection functions, and the PR021/K signalling unit are available for the PR222MP release.

The electronic releases are self-supplied and are made up of three current transformers, the PR222MP protection unit and a trip coil which acts directly on the circuit-breaker operating mechanism. The current transformers, housed inside the release box, supply the energy and the signal required for correct protection operation. Operation is guaranteed with a single-phase current equal to 18% of the rated current.

The release is temperature-compensated and is sensitive to missing phase according to Table IV of the IEC60947-4-1 7.2.1.5.2 Standards.

The T4 and T5 circuit-breakers for motor protection are perfectly integrated with the new line of ABB contactors. The latter - defined as A-line - together with the line of thermal relays and ABB SACE moulded-case circuit-breakers, is the basis for the new generation of apparatus specially designed to guarantee a system of products which can be integrated according to the required applications. All this has the aim not only of continually improving the products, but above all of providing designers, installers and end users with the best solutions in terms of performances and reliability, combined with the simplicity of the system.

The Tmax T4 and T5 circuit-breakers with PR222MP release and the "A" series of contactors are, in particular, an extraordinary solution in terms of compactness, sharing the same width and thereby saving space, assembly material, installation time and relative cabling operations. The combination of circuit-breaker-contactor allows an extremely compact protected starter to be made.

Circuit-breakers for motor protection

Integrated protection: PR222MP

2

1SBC210330F0004

Protection functions

Function L

Function L protects the motor against overloads according to the indications and classes defined by the IEC 60947-4-1 Standard.

The protection is based on a pre-defined model (ABB SACE international patent) which, by simulating the copper and iron over-temperatures inside the motor, allows precise safeguarding of the motor. The protection intervenes when the established over-temperature is reached. The trip time is fixed by selecting the trip class defined in the above-mentioned Standard.

The function is temperature-compensated and sensitive to a missing/unbalanced phase according to the IEC 60947-4-1 Standard.

In the case of an auxiliary power supply, the thermal memory function is guaranteed, which allows the release to continue to calculate the motor temperature even following an opening.

Function L, which cannot be excluded, can be set manually to $I_1=0.4\dots 1 \times I_n$ with 60 thresholds which can be set by means of the dip-switches on the front of the release, or electronically by means of the SACE PR010T test and configuration unit.

The starting class of the motor must then be selected, which determines the trip time for overload according to the IEC 60947-4-1 4.7.3 Table II Standards: class 10 A corresponds to a trip time $t_1= 4s$, class 10 to $t_1= 8s$, class 20 to $t_1= 16s$ and class 30 to $t_1= 24s$ at $7.2 \times I_n$. Setting this trip time can also be carried out electronically with the PR010T: the electronic steps are equal to 1s.

Tripping of this protection leads to contactor opening (with the PR212/CI unit). Any anomaly of the contactor would make the circuit-breaker open, thanks to the BACK UP function.

For protection L, there is then a pre-alarm and an alarm LED: the pre-alarm threshold value is equal to $0.9 \times I_1$ and the LED is permanently lit, whereas it flashes in case of alarm ($I > 1.05s \times I_1$).

It is also possible to transmit remotely the alarm of protection L, simply by connecting connector X3 to the dedicated contact.

1SBC210333F0004

Function R: protection against rotor block

Function R protects the motor against possible rotor block during operation. Protection R has the characteristic of protecting the motor in two different ways, according to whether the fault is present at start-up or whether it is present during normal service of an already active plant.

In the former case, protection R is linked to protection L for time selection as well: in the presence of a fault during start-up, protection R is inhibited for a time equal to the time set with the trip class. Once this time is exceeded, protection R becomes active leading to a trip after a fixed set t_5 time.

In the latter case, protection R is already active and the protection tripping time will be equal to t_5 . The protection intervenes when at least one of the phase currents exceeds the established value and remains over that threshold for time t_5 .

Function R can be set manually $I_5= 3\dots 10 \times I_1$ with 8 thresholds which can be set by means of the dip-switches on the front of the release, or with 70 thresholds by means of the SACE PR010T test and configuration unit (steps of $0.1 \times I_1$). The trip time t_5 can be set to 1, 4, 7 or 10 seconds by means of a dip-switch, or with steps of 0.5s by means of PR010T.

Tripping of this protection leads to contactor opening (with the PR212/CI unit); any anomaly of the contactor would make the circuit-breaker open, thanks to the BACK UP function.

1SBC210335F0004

Function I: protection against short-circuit

This protection function intervenes in the case of a short-circuit between phases. It is sufficient for just a single phase to exceed the set threshold to cause immediate opening of the circuit-breaker (protection cannot be excluded).

The PR222MP trip unit is able to recognize whether the motor to be protected is in the start-up phase or if there is a short-circuit: this is to allow starting in completely safe conditions.

Tripping of this protection makes the circuit-breaker open.

1SD0210332F0004

Function U: protection against missing phase and/or unbalanced

Function U can be used in those cases where a particularly precise control is needed regarding phase missing/unbalanced. This protection can be excluded and intervenes if the effective value of one or two currents drops below the level equal to 0.4 of the current I_n set for protection L and remains there for longer than 4 seconds.

This protection can be set electronically with the PR010T from 0.4 to 0.9 x I_n with time adjustable between 1 and 10s (steps of 0.5s).

Tripping of this protection leads to contactor opening (with the PR212/CI unit); any anomaly of the contactor would make the circuit-breaker open, thanks to the BACK UP function.

Parameterisation of the PR222MP release

Man/Elt: by means of a dip switch located on the front, the release can be provided for manual parameterisation (Man) of the thresholds and times acting directly on the dip switches located on the front of the release or with electronic parameterisation (Elt) by means of the PR010T.

Reset Mode

AUTO/Man: this function (AUTO) allows the state of activation of the PR212/CI to be automatically reset following contactor trip for L function, after a fixed time of 15s. The AUTO reset is only possible when there is an auxiliary voltage.

Setting the working modes

Normal: the Normal mode foresees the use of a circuit-breaker and a contactor: this configuration makes intervention towards the contactor possible, through the PR212/CI unit, when the PR222MP considers this appropriate.

Heavy: on the other hand, the heavy mode foresees the use of only the circuit-breaker and therefore the PR222MP sends the trip signal directly to the circuit-breaker.

BACK UP Function

This protection is conceived to manage the possibility that an opening command sent to the contactor might not have a positive outcome, i.e. that the contactor does not intervene. In this case, after having waiting for the time defined using the dip switch "k time" (**min** = 80ms or **max** = 160ms), the PR222MP sends a trip signal to the circuit-breaker.

Introducing a time delay between the command sent to the contactor and the back-up one is necessary to compensate the contactors actuation time.

Setting the PTC protection

PTC: this protection, by means of a PTC sensor inserted in the motor, controls the internal temperature. In case of overtemperature, the PR222MP will control opening of the contactor (when in "Normal" mode) or circuit-breaker (when in "Heavy" mode).

0/1: in this mode - alternative to protection by means of PTC probe - by means of the SACE PR021/K signalling unit (see page 3/34), it is possible to signal the state of a generic potential free contact (see page 5/15 for the electric diagram).

Circuit-breakers for applications up to 1000 V

Electrical characteristics

In the panorama of Tmax proposal there is also the range of circuit-breakers for applications in direct current or in alternating current up to 1000 V.

The typical sectors of application are in mining installations, road and rail tunnels, traction and industrial applications in general. The circuit-breakers are available in the three-pole and four-pole version with TMD or TMA adjustable thermomagnetic releases for use in direct and alternating current, or in the three-pole version with PR221DS and PR222DS/P electronic releases for applications in alternating current.

The dimensions of these circuit-breakers are the same as those of the standard ones. The circuit-breakers are supplied in the fixed version, with high terminal covers and insulating plates. They are compatible with all the electrical accessories, except for the residual current protection release. For the circuit-breakers in the two plug-in and withdrawable versions, please ask ABB SACE.

----------------------------------	------

Switch-disconnectors

Electrical characteristics

The Tmax switch-disconnectors derive from the corresponding circuit-breakers, of which they keep the overall dimensions, versions, fixing systems and the possibility of mounting accessories unchanged. This version only differs from the circuit-breakers in the absence of the protection releases.

They are characterised by a rated voltage of 690 V in alternating current and 750 V in direct current.

Applications

They can be used as general circuit-breakers in sub-switchboards as switching and isolation parts for lines, busbars or groups of apparatus, or as bus-ties. They can be part of general isolation devices of groups of machines or of complexes for motor switching and protection.

Isolation

The main function carried out by this apparatus consists of isolation of the circuit they are inserted in. Once the contacts are open they are at a distance which prevents an arc from striking, in accordance with the prescriptions in the standards regarding isolation behaviour. The position of the operating lever corresponds definitely with that of the contacts (positive operation).

Protection

Each switch-disconnector must be protected on the supply side by a coordinated device which safeguards it against short-circuits. The coordination table below indicates the Tmax circuit-breaker which can carry out the protection function for each switch-disconnector. These are always pieces of apparatus of a size corresponding to or smaller than that of the switch disconnector.

Making capacity

The making capacity I_{cm} is a performance of notable importance since a switch-disconnector must be able to withstand the dynamic, thermal and current stresses which can occur during closure without being destroyed, up to the short-circuit closing conditions.

Withstand capacity in closed position

This identifies the capacity to maintain the closed position for short-time overcurrents. It is a significant parameter which qualifies the performances of this apparatus.

Accessories

The range of accessories of the Tmax series is characterised by the completeness of the solutions proposed together with flexibility and facility of use.

3

Accessories

Versions and types

Starting from the fixed version with front terminals, the Tmax circuit-breakers can be converted into the various versions (plug-in for T2, T3, T4 and T5; withdrawable for T4 and T5), using the conversion Kits. This makes management of the product, its versions and stocks as a whole very flexible. In any case, it is always possible to request the circuit-breaker in the desired version completely preset in the factory, by ordering, on the same line, the fixed circuit-breaker and the conversion kit, to which must be added the fixed part.

1SDC210197R004

Fixed

The Tmax FIXED three-pole or four-pole version circuit-breakers foresee:

- circuit-breakers characterised by just two depths: 70 mm for Tmax T1, T2 and T3 and 103.5 mm for Tmax T4 and T5
- standard front in groups of circuit-breakers: 45 mm for Tmax T1, T2 and T3 and 105 mm for T4 and T5
- flange for compartment door
- possibility of assembly on back plate (or on DIN rail with T1, T2 and T3, with the help of the special accessory, see page 3/39)
- thermomagnetic (on Tmax T1, T2, T3, T4 and T5) or electronic (on Tmax T2, T4 and T5) releases
- standard FC Cu type terminals (front for copper cables) for T1 and F type (front) for T2, T3, T4 and T5.

1SDC210197R004

Plug-in

The PLUG-IN version of the circuit-breaker (Tmax T2, T3, T4 and T5) consists of:

- fixed part to be installed directly on the back plate of the unit;
- moving part obtained from the fixed circuit-breaker with addition of the isolating contacts (near the connection terminals), of the rear frame (for fixing to the fixed part) and of the terminal covers.

The circuit-breaker is racked out by unscrewing the top and bottom fixing screws. A special lock prevents circuit-breaker racking in and racking out with the contacts in the closed position.

When the circuit-breaker has electrical accessories mounted (SOR, UVR, MOS, MOE, MOE-E, AUX, AUX-E, AUE and RC222), the socket-plug connectors or the adapters for isolation of the relative auxiliary circuits must also be ordered (see page 3/23).

Accessories

Versions and types

Withdrawable

The circuit-breakers in the WITHDRAWABLE version (Tmax T4 and T5) are made up of:

- fixed part to be installed directly on the back plate of the unit with the side group mounted on the fixed part to allow the racking-out and racking-in movement
- moving part obtained from the fixed circuit-breaker with addition of the isolating contacts (near the connection terminals), of the rear frame (which is coupled to the prepared side on the fixed part, for sliding) and of the terminal covers
- mandatory accessory to be applied onto the front of the circuit-breaker selected between front for lever operating mechanism (standard supply for interlocks with factory-mounted accessories), motor operator and rotary handle operating mechanism. Application of one of these accessories allows the racking-in and racking-out of the moving part with the compartment door closed.

Racking-in and racking-out of the moving part is carried out by means of the special operating lever always supplied with the fixed part. This particular device allows the circuit-breaker to be placed in the isolated position (with power and auxiliary circuits disconnected) with the compartment door closed, to the great advantage of operator safety. The handle can only be inserted with the circuit-breaker open. Once removed or racked-out, the circuit-breaker can be operated in open/closed and, by means of special connection extensions, blank tests can be carried out of the auxiliary control circuit functions.

The withdrawable version T4 and T5 circuit-breakers can only be fitted with pre-cabled electrical accessories, provided with ADP adapters suitable for isolation of the relative auxiliary circuits (see page 3/23).

Kit for conversion into moving part of plug-in for T2 - T3 - T4 - T5

Allows the fixed circuit-breaker with front terminals to be converted into the moving part of a plug-in circuit-breaker. The kit consists of:

- isolating contacts
- anti-racking out safety device
- assembly screws and nuts
- low terminal covers for the moving part.

The fixed part for plug-in version is necessary to complete the circuit-breaker.

T4-T5

1SDC210199F0004

Kit for conversion into moving part of withdrawable for T4 and T5

Allows the fixed circuit-breaker with front terminals to be converted into the moving part of a withdrawable circuit-breaker. The kit consists of:

- isolating contacts
- frame
- assembly screws and nuts

– low terminal covers for the moving part.

The circuit-breakers in the withdrawable version must always be completed either with the front for lever operating mechanism (standard supply for interlocks with factory-mounted ac-

cessories), rotary handle operating mechanism or motor operator.

The fixed part for withdrawable version is necessary to complete the circuit-breaker.

1SDC210200F0004

1SDC210199F0004

Accessories

Versions and types

Fixed part - FP

The fixed part, available for T2, T3, T4 and T5, allows the circuit-breaker to be made in the plug-in or withdrawable version. Different positions of the circuit-breaker are possible:

- plug-in: racked-in, removed
- withdrawable: racked-in, removed and racked-out.

The fixed parts for T2 and T3 are available, in the standard version, with front terminals (F). A distinguishing characteristic is the possibility of equipping these fixed parts with the same terminal, terminal cover and phase separator kits used for the fixed circuit-breakers. With Tmax T4 and T5, codes of fixed parts are available with different types of terminals (EF, HR, VR). The fixed parts with EF terminals, moreover, can be also equipped with the suitable ES, FC Cu and FC CuAl terminals.

The fixed part for the withdrawable version circuit-breakers is fitted with a guide to support the moving part during the isolation or racking-out operations and is fitted with racking-out crank handle and flange for the compartment door to replace the one supplied with the fixed version circuit-breaker.

15SD210121F0004

Kit for conversion of fixed part of plug-in into fixed part of withdrawable

For Tmax T4 and T5 is available a conversion kit which is made up by a guide to prepare the fixed part of the circuit-breaker in the plug-in version in the fixed part of the circuit-breaker in the withdrawable version, a racking-out crank handle and by the flange for the compartment door to replace the one supplied with the fixed or plug-in circuit-breaker version.

15SD210201F0004

Racking-out crank handle

This allows racking-out and racking-in of the circuit-breaker in the withdrawable version into the fixed part, with the door closed. The crank handle is the same for the whole range of circuit-breakers and is automatically supplied with the fixed part of withdrawable circuit-breakers or with the conversion kit for fixed part of plug-in into fixed part of withdrawable.

15SD210202F0004

Accessories

Connection terminals

The basic version circuit-breaker is supplied with:

- front terminals for copper cables (FC Cu), for the Tmax T1 circuit-breaker
- front terminals (F), for the Tmax T2, T3, T4 and T5 circuit-breaker.

Different types of terminals which can be combined together in different ways are also available (top of one type, bottom of a different type), thereby allowing the circuit-breaker to be connected to the plant in the most suitable way in relation to installation requirements.

The following can be distinguished:

- **front terminals** which allow connection of cables or busbars working directly from the front of the circuit-breaker
- **orientated rear terminals** which allow installation of the circuit-breakers in switchboards with rear access to both the cable and busbar connections.

Terminals are available for direct connection of bare copper or aluminium cables and terminals for connection of busbars or cables with cable lugs.

A notable characteristic for T2 and T3 is that all the different types of terminals available can be mounted either on the fixed version circuit-breaker or on the corresponding fixed part of the plug-in circuit-breaker. On the other hand, for T4 and T5 fixed part can mount EF, HR or VR terminals, and, moreover, fixed part with EF terminals can be equipped also with ES, FC Cu and FC CuAl terminals.

On page 3/9 and following, the information needed to make the connections for each type of terminal are summarised. For connection with bare cables, the minimum and maximum cross-sections of the cables which can be clamped in the terminals, the type of cables (rigid or flexible) and the diameter of the terminal are indicated. For connections with busbars, flat terminals of different sizes and composition are recommended.

The torque values to be applied to the tightening screws of the terminals for cables and to the screws used to connect the busbars to the flat terminals are indicated.

The circuit-breakers can be ordered complete with the terminals required (mounted directly in the factory), by associating the terminal kit codes with the code of the standard version circuit-breaker, or the terminals can be ordered individually in packs of 3 - 4 - 6 or 8 pieces.

To receive the circuit-breaker with mixed terminals, the two terminal half-kits must be specified, loading the one to be mounted on top as the first half-kit and then the one to be mounted below.

It is also very important to remember that if the top terminals are the same as the bottom ones, it is compulsory to order the complete kit (6 or 8 pieces) and not the two half-kits: the configuration would not be accepted by the system.

Insulating terminal covers

The terminal covers are applied to the circuit-breaker to prevent accidental contact with live parts and thereby guarantee protection against direct contacts. The following are available:

- low terminal covers (LTC): these guarantee IP40 degree of protection for fixed circuit-breakers with rear terminals and for moving parts of plug-in and withdrawable circuit-breakers
- high terminal covers (HTC): these guarantee IP40 degree of protection, for fixed circuit-breakers with front, front extended, front for cables terminals.

With Tmax T2 and T3, the fixed parts of plug-in circuit-breakers can use the same terminal covers as the corresponding fixed circuit-breakers. For fixed parts of T4 and T5, the proper terminal covers (TC-FP) are available.

The degrees of protection indicated are valid for the circuit-breaker installed in a switchboard.

Accessories

Connection terminals

Phase separators

These allow the insulation characteristics between the phases at the connections to be increased. They are mounted from the front, even with the circuit-breaker already installed, inserting them into the corresponding slots and they are available in two versions:

- 100 mm high
- 200 mm high.

The H=100 mm phase separators are supplied as compulsory with front extended type terminals (EF), whereas the ones with height H=200 mm are compulsory with front extended spread type terminals (ES).

They are incompatible with both the high and low insulating terminal covers.

The fixed parts can use the same phase separating partitions as the corresponding fixed circuit-breakers.

With the phase separating partitions mounted, on request, with Tmax T1, T2 and T3 a special kit is available to reach IP40 degree of protection from the front of the circuit-breaker.

Moreover, it is possible to mount the phase separating partitions between two circuit-breakers or fixed parts side by side.

1SD2110203F0004

Screws for sealing the terminal covers

These are applied to the terminal covers of fixed circuit-breakers or to the moving parts of plug-in or withdrawable circuit-breakers. They prevent removal of both the high and low terminal covers and can be locked with a wire and lead seal.

1SD2110127F0004

Kit for taking up the auxiliary power supply

Special kits are available with the Tmax T2, T3, T4 and T5 circuit-breakers for taking up the auxiliary power supply directly from the connection terminals. They can only be combined with the front terminals for copper cables (FC Cu) or with the front terminals (F) for T3, T4 and T5.

Accessories

Service releases

The service releases, shunt opening release and undervoltage release, housed and fixed in the slot on the left-hand side of the circuit-breaker are always alternative to each other for T1, T2 and T3, both in the three- and four-pole version; whereas, for T4 and T5 in the four-pole version (the releases) can be housed simultaneously. They can be supplied in the pre-cabled version with 1 m long free cables for T1, T2 and T3 or with socket-plug connectors, still with 1m long cables for T4 and T5, or in the uncabled version, with wiring carried out by the customer. Assembly is carried out by pressing into the appropriate seat on the left-hand part of the circuit-breaker and fixing with the screw provided.

Shunt opening release - SOR

Allows circuit-breaker opening by means of an electric command. Operation of the release is guaranteed for a voltage between 70% and 110% of the rated power supply voltage value U_n , both in alternating current and in direct current. The SOR shunt opening release is always fitted with a limit contact for cutting off the power supply in the open position and with the release tripped. For T4 and T5 in the three pole version, the pre-cabled shunt opening release can be housed in the slot of the third pole.

T1-T2-T3

Undervoltage release - UVR

Opens the circuit-breaker due to lack of release power supply voltage or to drops to values under $0.7 \times U_n$ with a trip range from 0.7 to $0.35 \times U_n$. After tripping, the circuit-breaker can be closed again starting from a voltage higher than $0.85 \times U_n$. With the undervoltage release de-energised, it is not possible to close the circuit-breaker or the main contacts.

UVR - Electrical characteristics

Time delay device for undervoltage release - UVD

The undervoltage release can be combined with an external electronic power supply time delay device, which allows circuit-breaker opening to be delayed in the case of a drop or failure in the power supply voltage of the release itself, according to preset and adjustable delays, in order to prevent unwarranted trips caused by temporary malfunctions. The delay device must be combined with an undervoltage release with the same corresponding voltage. This time delay device can also be combined either with the Tmax T1...T5 or Isomax circuit-breakers.

UVD	
Circuit-breaker	Power supply voltage [V AC/DC]
T1...T5	24...30

T1...T5	110...125
T1...T5	220...250
Delay which can be set [s]	0.25 - 0.5 - 0.75 - 1 - 1.25 - 2 - 2.5 - 3

3

1SDC210128F0004

Testing extension for service releases

Available for Tmax T4 and T5, this allows the service releases to be supplied with the circuit-breaker in the removed position. With the circuit-breaker in safe conditions, i.e. isolated in relation to the power circuits, this makes it possible to carry out blank tests of the circuit-breaker functionality.

1SDC210128F0004

Accessories

Electrical signals

These allow information on the operating state of the circuit-breaker to be taken outside. Installation of these accessories is carried out directly from the front of the circuit-breaker in special slots placed on the right-hand side of the circuit-breaker, completely segregated from the live parts - all to the benefit of user safety. They can be supplied in the pre-cabled version with free cables 1 m long for T1, T2 and T3 or with socket-plug connectors, still with cables 1 m long, for T4 and T5, or in the uncabled version, with cabling carried out by the customer, according to the type of auxiliary contact.

Auxiliary contacts for external signalling - AUX and AUX-E

The AUX auxiliary contacts carry out electrical signalling of the operating state of the circuit-breaker:

- open/closed (Q): indicates the position of the circuit-breaker contacts
- release trip (SY): signals circuit-breaker opening due to overcurrent release trip (for overload or short-circuit), trip of the residual current release, of the opening coil or of the undervoltage release, of the emergency opening pushbutton of the motor operator or due to operation of the test pushbutton
- contact for signalling electronic release trip (S51): signals intervention of one of the protection functions of the electronic release.

Signalling is reset when the circuit-breaker is rearmed (reset).

The auxiliary contacts can be supplied (according to the type) either in the version with cabling to be carried out by the customer by means of connection to the terminals integrated with the auxiliary contacts, or in the pre-cabled version with 1 m long cables for T1, T2 and T3 or with connectors, still with 1 m long cables, for T4 and T5.

The auxiliary contacts are available for use with different voltages either in direct or alternating current:

T1, T2, T3, T4 and T5 - 250 V AC/DC

Both in the pre-cabled and uncabled version for use at 250 V AC/DC:

- a contact for signalling (on changeover) open/closed plus a contact (on changeover) for release trip [1Q+1SY]
- three contacts for signalling (on changeover) open/closed plus a contact (on changeover) for release trip [3Q+1SY].

AUX - Electrical characteristics

AUX 250 V - T1, T2, T3, T4 and T5

Power supply voltage	Service current	
	Category of utilisation (IEC 60947-5-1)	
	AC 14	DC 13
125 V	6 A	0.3 A
250 V	5 A	0.15 A

AUX-C - 250 V AC/DC

AUX 400 V AC

AUX 250 V AC/DC

AUX-C 250 V AC/DC

AUX 400 V AC

Accessories

Electrical signals

T4 and T5 - 400 V AC

Only in the pre-cabled version for use at 400 V AC:

- a contact for signalling (on changeover) open/closed plus a contact (on changeover) for release trip [1Q+1SY]
- two contacts for signalling (on changeover) open/closed [2Q].

T1, T2, T3, T4 and T5 - 24 V AC/DC

Gold-plated in both the pre-cabled and uncabled version for T4 and T5 and only in the uncabled version for T1, T2 and T3 for use up to 24 V DC (digital contacts):

- three contacts for signalling (on changeover) open/closed plus a contact (on changeover) for release trip [3Q+1SY].

T2 with PR221DS electronic release (AUX 250 V AC/DC)

Only in the pre-cabled version:

- a contact for signalling alarm which signals intervention of one of the protection functions of the electronic release plus a contact for signalling (on changeover) open/closed plus a contact for signalling (on changeover) release trip [1S51+1Q+1SY].
- two open/closed signalling contacts plus one release tripped signalling contact (on changeover) [2Q+1SY]

T4 and T5 with PR221DS, PR222DS/P, PR222DS/PD or PR222MP electronic release (AUX-SA) - 250 V AC

Only in the pre-cabled version for use at 250 V AC:

- a contact for signalling electronic release trip [1S51].

T4 and T5 (AUX-MO)

Only in the uncabled version, to be combined with the MOE or MOE-E motor operator:

- a contact for signalling the operating mode of the circuit-breaker with the motor operator: manual or remote.

T4 and T5 with PR222DS/PD electronic release (AUX-E)

Only in the pre-cabled version, the auxiliary contacts AUX-E (also called electronic version contacts) communicate the state of the circuit-breaker to the electronic release and make (on changeover) an open/closed signal available to the outside and one (on changeover) for electronic release trip [1Q+1SY]. They can only be combined with the PR222DS/PD electronic release and only function when there is a 24 V DC auxiliary power supply to the release for the communication functions.

The AUX-E contacts can, moreover, be directly connected to the MOE-E motor operator (see page 3/22).

A changeover contact signalling trip of the residual current protection is always supplied for the circuit-breakers combined with the RC221 and RC222 residual current releases. With the RC222 changeover contacts for signalling pre-alarm and alarm are also available.

Types of auxiliary contacts

		Version	T1	T2 TMD	T2 PR221DS	T3	T4	T5

Testing extension for auxiliary contacts

Available for Tmax T4 and T5 circuit-breakers, this allows the auxiliary contacts to be connected to the relative power supply circuit with the circuit-breaker in the removed position. With the circuit-breaker in a safe position, i.e. isolated in relation to the power circuits, it is possible to carry out blank function tests of the circuit-breaker.

1SD0210219F0004

1SD0210206F0004

Early auxiliary contacts - AUE

Two normally open contacts, advanced in relation to closing. They allow the undervoltage release or a control device to be supplied in advance, in relation to closing of the main contacts, in compliance with the IEC 60204-1 and VDE 0113 Standards. They are mounted inside the direct and transmitted rotary handle operating mechanism. The early contacts are only supplied in the cabled version with 1 m long cables, complete with socket-plug with 6 poles for T1, T2 and T3 or with socket-plug connectors with 1 m. cables for T4 and T5. It is necessary to bear in mind that the connectors for T4 and T5, once inserted in the special slot on the right-hand side of the circuit-breaker, extend in relation to the outline of the circuit-breaker itself.

1SD0210151F0004

Accessories

Electrical signals

1SDC210153F0004

Auxiliary position contacts - AUP

For the fixed part of circuit-breakers, Tmax T2, T3, T4 and T5, these provide electrical signalling of the circuit-breaker position in relation to the fixed part. The following auxiliary position contacts are available:

T2, T3

- contacts signalling circuit-breaker racked-in

T4, T5

- circuit-breaker racked-in signalling contacts for plug-in and withdrawable versions
- circuit-breaker racked-out signalling contacts only for withdrawable version
- circuit-breaker racked-in signalling contacts for plug-in and withdrawable versions 24 V DC
- circuit-breaker racked-out signalling contacts only for withdrawable version 24 V DC.

A maximum of three contacts in any combination can be installed on the fixed part of T2, T3, T4 and T5.

For T4 and T5 in the withdrawable version it is only possible to house a circuit-breaker racked-out signalling contact.

3

Accessories

Remote control

Solenoid operator for T1, T2 and T3 - MOS

Allows remote circuit-breaker opening and closing control and is particularly recommended for use in electric network supervision and control systems. A selector allows passage from automatic to manual operation. It is always provided with a padlock in the open position.

It operates both circuit-breaker opening and closing, working directly on the circuit-breaker lever.

It is offered in two versions, one "side-by-side" with the circuit-breaker, with T1 and T2, for installation on a panel or DIN EN 50022 rail, the other on the "front", with T1, T2 and T3, suitable for installation directly on the front of the circuit-breaker. The latter is complete with operating handle. The front version can also be used with plug-in circuit-breakers.

Coupling with the residual current release is only allowed for a circuit-breaker with solenoid operator side-by-side, to allow

access to the user interface of the residual current release from the front of the switchgear. In fact, using the solenoid operator superimposed would imply the circuit-breaker position on the rear of the door and its residual current release and the interface would no longer be accessible. This combination can only be installed directly on the back plate of the switchgear.

Both versions can be used either in the three-pole or four-pole version.

The solenoid operator is supplied complete with 1m long cables and, just for the superimposed version, with a socket-plug connector with 6 poles.

Both the opening and closing commands are operated by the solenoid which acts directly on the circuit-breaker lever. The table shows the power supply voltage values U_n [V].

Rated voltage, U_n

AC	[V]	110...250
DC	[V]	48...60 / 110...250
Operating voltage		85...110% U_n
Inrush power consumption		1800 [VA] / 1000 [W]
Time	opening [s]	< 0.1
	closing [s]	< 0.1
Mechanical life	[no. Operations]	25000
	[no. Operations/h]	240 (T1 e T2); 120 (T3)
Degree of protection, on the front		IP30
Minimum control impulse time on opening and closing		
	[ms]	>100

Accessories

Remote control

1SD/C2/10207/F0004

Stored energy motor operator for T4 and T5 - MOE and MOE-E

With the stored energy motor operator, it is possible to control both opening and closing of the circuit-breaker on which it is installed. During opening of the circuit-breaker, the spring system is recharged automatically: the stored energy is exploited in this way to close the circuit-breaker.

The motor operator is always supplied with socket-plug connectors with 1 m long cables and is always fitted with a padlock. The connectors, once inserted in the special slot on the left-hand side of the circuit-breaker, extend in relation to the outline of the circuit-breaker itself. They are only compatible with pre-cabled electrical accessories.

The same flange already supplied with the circuit-breaker can be used.

The motor operator can be fitted both with a key lock in the open position (with the same MOL-S keys for groups of circuit-breakers or different MOL-D keys) and with an MOL-M key lock against manual operation: in the former case, the lock in the open position is both of electrical and mechanical type, in the latter case, only of mechanical type, i.e. only closing from the front of the circuit-breaker (remote closing is allowed).

In the case of interlocked circuit-breakers, for safety reasons the key lock against manual operation is required.

The motor operator is always fitted with an auxiliary contact to signal "auto" or "manual" (not on changeover). On request, it can also be fitted with an AUX-MO auxiliary contact (on changeover), which provides a signal of its state of service: "auto" (remote control of the circuit-breaker) or "manual".

If the circuit-breaker is fitted with the PR222DS/PD electronic release, instead of the MOE motor operator, it is necessary to use the MOE-E motor operator: for its use, the circuit-breaker must also be fitted with the AUX-E auxiliary contacts. The MOE-E allows use of the digital signals coming from the supervision and control system, by means of the PR222DS/PD release and the AUX-E contacts, and to convert these into power signals to operate the motor operator. All the characteristics indicated above for the MOE motor operator are also valid for the MOE-E.

The table gives the power supply voltage values U_n [V].

MOE and MOE-E	Tmax T4, T5	
	AC [V]	DC [V]
Rated voltage, U_n	-	24
	-	48...60
	110...125	110...125
	220...250	220...250
	380	-
Operating voltage	85...110% U_n 85...110% U_n	
Power consumption on inrush P_s	≤ 300 VA	≤ 300 W
Power consumption in service P_c	≤ 150 VA	≤ 150 W
Duration	opening [s]	1,5
	closing [s]	< 0,1
	resetting [s]	3
Mechanical life	[no. operations]	20000
Degree of protection, on the front	IP30	
Minimum opening and closing control time	[ms]	≥ 150

1SD/C2/10222/F0004

Testing extension for motor operators

Available for circuit-breakers Tmax T4 and T5, this allows the motor operator to be connected to the relative power supply circuit with the circuit-breaker in the removed position. With the circuit-breaker in a safe position, i.e. isolated in relation to the power circuits, it is possible to carry out blank tests of the circuit-breaker functions.

Adapters - ADP

For the pre-cabled electrical accessories, it is necessary to use the adapters to be coupled with the plug, which will then be connected to the socket located on the fixed part for the moving parts of the plug-in or withdrawable version of Tmax T4 and T5.

Depending on the electrical accessories required, it will be necessary to ask for one or two adapters to be mounted on the left side and/or on the right side of the moving part

There are four types of adapters available:

- 5-way adapters
- 6-way adapters
- 10-way adapters
- 12-way adapters.

The table below indicates the adapters which must be used for the various possible configurations of electrical accessories:

ADP adapters for T4 and T5 cabled accessories

Accessories

Operating mechanism and locks

Rotary handle operating mechanism - RHD/RHE

Thanks to its ergonomic grip, the rotary handle facilitates operation. It is always fitted with a padlock-lock in the open position which prevents circuit-breaker closing. The opening in the padlock-lock can take up to 3 padlocks - 7 mm Ø stem (not supplied). It is always fitted with a compartment door lock and on request it can be supplied with a key lock in the open position. Application of the rotary handle operating mechanism is an alternative to the motor operator and to the front interlocking plate (MIF) for T1, T2 and T3, or to the motor operator and to the front for lever operating mechanism for T4 and T5. The rotary handle operating mechanism is available in either the direct version or in the transmitted version on the compartment door.

The release settings and nameplate data remain accessible to the user.

The rotary handle operating mechanism in the emergency version is also available, complete with yellow-red handle and yellow background, suitable for controlling machine tools.

The transmitted rotary handle operating mechanisms can be ordered by building up the following three devices:

- rotary handle on the compartment door
- transmission rod (500 mm)
- base for circuit-breaker

or, alternatively, by using the code of the ready-configured version.

T4-T5

1SDC210210F004

Front for lever operating mechanism - FLD

This can be installed on fixed, plug-in or withdrawable Tmax T4 and T5 circuit-breakers. In the case of withdrawable circuit-breakers, installed in a switchboard, it allows the IP40 degree of protection to be maintained for the whole isolation run of the circuit-breaker. It is always fitted with a padlock in the open position (6 mm Ø stem up to three padlocks - not supplied) which prevents closing of the circuit-breaker and of the compartment door, and with compartment door lock. On request, it can be fitted with a key lock in the open position.

It is available in the following versions:

- for fixed or plug-in circuit-breaker
- for withdrawable circuit-breaker.

The front for lever operating mechanism is always an alternative to the motor operator and to the rotary handle and to the display FDU.

The same flange for the compartment door already supplied with the circuit-breaker or the one supplied with the conversion kit for withdrawable version can be used.

1SDC210220F004

1SDC210162F004

Key lock for rotary handle operating mechanism for T1, T2 and T3 - RHL

This allows the mechanical closing operation of the circuit-breaker to be locked.

The following versions are available:

- lock with different key for each circuit-breaker
- lock with the numbered key for groups of circuit-breakers.

The circuit-breaker in the open position ensures isolation of the circuit in accordance with the IEC 60947-2 Standard. It is also available in the version which allows the lock both in the open and closed position. The lock in the closed position does not prevent release of the mechanism following a fault or remote control.

1SDC210163F004

Key lock on the circuit-breaker for T1, T2 and T3 - KLC

This allows the mechanical closing operation of the circuit-breaker to be locked and is installed directly on the front in the slot in correspondence with the left pole. It cannot be mounted with a front operating mechanism, a rotary handle operating mechanism, a motor operator, RC221/RC222 residual current releases and, only in the case of three-pole circuit-breakers, with service releases (UVR, SOR). The key lock is the Ronis 622 type and is available in two versions:

- standard type, with key only removable with the circuit-breaker locked
- special type, with key removable in both positions.

Accessories

Operating mechanism and locks

Key lock for T4 and T5 - KLF-D and KLF-S

This allows mechanical operation of the circuit-breaker to be locked. This lock can be used with the direct or transmitted rotary handle operating mechanism or with the front for lever operating mechanism.

The lock of the circuit-breaker in the open position ensures isolation of the circuit in accordance with the IEC 60947-2 Standard. For T4 and T5 key locks in the open position are available either with different keys (KLF-D) or with the same keys (KLF-S): in this case, up to four different key numbering codes are available (n. 2005-2006-2007-2008).

Lock in the racked-out position for fixed part (T4 and T5)

For T4 and T5 withdrawable circuit-breakers, key or padlocks-locks are available to be applied onto the rail of the fixed part, to prevent racking-in of the plug-in part.

Selection can be made among the following:

- key lock with different keys (KLF-D FP)
- key lock with the same keys for groups of circuit-breakers (KLF-S FP)
- Ronis type key lock (KLF-D Ronis FP)
- padlock, which can take up to three padlocks with 6 mm stem \varnothing , not supplied (PLL FP).

Sealable thermal adjustment lock

This is applied to the circuit-breaker cover near the thermal element regulator of the TMD thermomagnetic release for T1, T2 and T3 and prevents it being tampered with.

1SDC210164R004

IP54 protection for rotary handle

Allows IP54 degree of protection to be obtained.

It is available for the transmitted rotary handle operating mechanism on the compartment door (RHE) for the T1, T2, T3, T4 and T5 circuit-breakers.

1SDC210165F004

1SDC210168F0004

1SDC210167F0004

Padlock for operating lever - PLL

This is applied to the T1 - T2 - T3 circuit-breaker cover to prevent the lever closing or opening operation. It allows installation up to a maximum of three padlocks - 7 mm Ø stem (not supplied). It is available in the following versions:

- plug-in locking device only of the closing operation
- locking plate on the closing and opening operation according to the assembly position. The lock on the opening operation does not prevent release of the mechanism following a fault or remote control command
- locking plate just for the closing operation.

It is incompatible with the front accessories: solenoid operator, rotary handle operating mechanism and mechanic interlock.

3

1SDC21016FF0004

1SDC210375F0004

Mechanical interlock

T1, T2, T3

The mechanical MIF interlock can be applied on the front of two T1, T2 or T3 circuit-breakers mounted side by side, in either the three-pole or four-pole fixed version and prevents simultaneous closing of the two circuit-breakers. Fixing is carried out directly on the back plate of the switchboard. The front interlocking plate allows installation of a padlock in order to fix the position (possibility of locking in the O-O position as well). It is also possible to interlock three circuit-breakers side by side, using the proper plate, thereby making the following interlock combinations: IOO-OIO-OOI-OOO.

It is incompatible with the front accessories (solenoid operator, rotary handle operating mechanism) and with the residual current releases.

The MIR mechanical interlock is available for T3 in the fixed or plug-in version, both three-pole and four-pole. This rear interlock, available in the horizontal or vertical version (MIR-H, MIR-V), is compatible with all the front accessories and with the residual current release (only MIR-H). The following interlock combinations can be made: IO-OI-OO.

T4, T5

The mechanical interlock for T4 and T5 allows installation of two circuit-breakers on a single support and, by means of special lever mechanisms, makes them mechanically interdependent.

This rear interlock consists of a vertical or horizontal frame group (MIR-HB or MIR-VB), made up of a metal frame and of the leverisms to interlock, and of a couple of plates (MIR-P) on which the circuit-breakers are housed. Types of back plates:

Interlock			
Type			
A	T4 (F-P-W)	+	T4 (F-P-W)
B	T4 (F-P-W)	+	T5 400 (F-P-W) or T5 630 (F)
C	T4 (F-P-W)	+	T5 630 (P-W)
D	T5 400 (F-P-W) or T5 630 (F)	+	T5 400 (F-P-W) or T5 630 (F)
E	T5 400 (F-P-W) or T5 630 (F)	+	T5 630 (P-W)
F	T5 630 (P-W)	+	T5 630 (P-W)

It will be the customer to make up the interlock selecting the back plates available and the horizontal or vertical frames. The following interlock combinations can be made: IO-OI-OO.

Since this is a rear interlock, all the front accessories which are compatible with the circuit-breakers installed can be used.

For instruction for ordering, please see the example at page 7/5.

1SDC210322F0004

Accessories

Residual current releases

All the Tmax series of circuit-breakers are preset for combined assembly with residual current releases. In particular, the Tmax T1, T2 and T3 circuit-breakers can be combined with the new version of the SACE RC221 or RC222 series of residual current releases and four-pole T4 and T5 with RC222 or RC223 to be installed below the circuit-breaker.

Apart from the protection against overloads and short-circuits typical of automatic circuit-breakers, the residual current circuit-breakers derived from them also guarantee protection of people and protection against earth fault currents, thereby ensuring protection against direct contacts, indirect contacts and fire hazards. The residual current releases can also be mounted on the Tmax T1D, T3D, T4D and T5D switch-disconnectors. In that case, the derived apparatus is a “pure” residual current circuit-breaker, i.e. one which only guarantees residual current protection and not the protections typical of circuit-breakers. “Pure” residual current circuit-breakers are only sensitive to the earth fault current and are generally applied as main switch-disconnectors in small distribution switchboards towards end users.

The use of “pure” and “impure” residual current circuit-breakers allows continual monitoring of the state of plant insulation, ensuring efficient protection against fire and explosion hazards and, when the devices have $I_{\Delta n} \leq 30 \text{ mA}$, ensure protection of people against indirect and direct earth contacts to fulfil the compulsory measures foreseen by the accident prevention regulations and prescriptions. The residual current releases are constructed in compliance with the following Standards:

- IEC 60947-2 appendix B
- IEC 60255-3 (SACE RCQ and RC223) and IEC 61000: for protection against unwarranted release
- IEC 60755 (SACE RCQ): for insensitivity to direct current components.

RC221 and RC222 residual current releases for T1, T2 and T3

The RC221 and RC222 residual current releases can be installed either on the Tmax T1, T2 and T3 circuit-breakers, or on the T1D and T3D switch-disconnectors. The versions available make their use possible both with three-pole and four-pole circuit-breakers, in the fixed version.

They are constructed using electronic technology and act directly on the circuit-breaker by means of a trip coil, supplied with the residual current release, to be housed in the special slot made in the left-hand pole area. They do not require an auxiliary power supply as they are supplied directly by the network and

their operation is guaranteed even with only a single phase plus neutral or only two phases supplied with voltage and in the presence of unidirectional pulsating currents with direct components.

All the possible connection combinations are allowed, except for guaranteeing, in the four-pole version, connection of the neutral to the first pole on the left.

The RC221 and RC222 residual current releases can either be supplied from above or from below.

The operating conditions of the apparatus can be continually controlled by means of the elec-

tronic circuit test pushbutton and the magnetic indicator of residual current trip.

A disconnection device of the power supply during the insulation test is available.

The four-pole circuit-breaker complete with residual current release can be fitted with the electrical accessories normally available for the circuit-breaker. The shunt opening and under-voltage releases are housed in the special slot made in the neutral pole for the four-pole circuit-breakers, whereas they are incompatible with the three-pole circuit-breakers.

1SDC21017R0004

1SDC21021R0004

Accessories

Residual current releases

1SDC210171F0004

1SDC210324F0004

The residual current releases are supplied complete with:

- a trip coil to be housed in the area of the third pole, complete with an auxiliary contact signalling residual current release trip
- dedicated flange.

The bracket for fixing onto DIN 50022 rail is available on request.

The configuration foresees insertion of the circuit-breaker on the structure of the corresponding residual current release, making access to the adjustments on the left-hand side of the circuit-breaker available, whilst the toroid is in the underneath position.

A distinguishing characteristic is provided by the type of cable connection which is made di-

rectly on the circuit-breaker, once the residual current release has been mounted, thereby ensuring simplification and rationalisation of the installation procedure.

With Tmax T2 and T3, only front terminals for copper cables (FC Cu) at the bottom are mounted on the residual current releases. For this reason, when the residual current release is ordered, the FC Cu terminal semi-kit is always supplied (consult the code section on page 7/36).

On the other hand, for four-pole Tmax T1, it is also possible to mount the rear horizontal flat terminal kit below (HR for RC221/RC222).

Furthermore, still for four-pole T1, a version of the RC222 residual current release is available

in 200 mm modules. This release keeps the same technical characteristics as the normal RC222 for T1, T2 and T3 but, thanks to its reduced height, allows installation in 200 mm modules. Its special shape also allows a reduction in the overall dimensions when two or more units are placed side by side.

3

RC222 residual current release for T4 and T5

With T4 and T5, in the four-pole version, it is possible to use an RC222 residual current release below the circuit-breaker.

This RC222 residual current release, in the fixed version, can easily be converted into plug-in by adding the special conversion kit.

The RC222 release is constructed using electronic technology and acts directly on the circuit-breaker by means of a trip coil, supplied with the residual current release, to be housed in the special slot made in the left-hand pole area.

It does not require an auxiliary power supply as they are supplied directly by the network and their operation is guaranteed even with only a single phase plus neutral or only two phases supplied with voltage and in the

presence of unidirectional pulsating currents with direct components.

All the possible connection combinations are allowed as long as there is that of the neutral to the first pole on the left. The RC222 residual current release can either be supplied from above or from below.

The operating conditions of the apparatus can be continually controlled by means of the electronic circuit test pushbutton and the magnetic indicator of residual current trip.

A disconnection device of the power supply during the insulation test is available.

The four-pole circuit-breaker complete with residual current release can be fitted with the electrical accessories normally available for the circuit-breaker.

The shunt opening and under-voltage releases are housed in the special slot made in the neutral pole for the four-pole circuit-breakers.

The residual current release is supplied complete with:

- a trip coil to be housed in the area of the third pole, complete with an auxiliary contact signalling residual current release trip
- dedicated flange.

The release is supplied with standard front terminals, but it can also be combined with all the terminals available for the corresponding circuit-breaker.

⁽¹⁾ Operation up to 50 V Phase-Neutral

RC223 (B type) residual current release for T4

Along with the family of residual current releases illustrated previously, ABB SACE is developing the RC223 (B type) residual current release, which can only be combined with the Tmax T4 four-pole circuit-breaker in the fixed or plug-in version. The range of operation of the primary line-to-line voltage of this residual current release varies between 110 V and 440 V, with operation starting from 55 V phase-neutral. It is characterised by the same types of reference as the RC222 (S and AE type) release, but can also boast conformity with type B operation, which guarantees sensitiv-

ity to residual fault currents with alternating, alternating pulsating and direct current components. The reference Standards are: IEC 60947-1, IEC 60947-2 Appendix B, and IEC 60755. Apart from the signals and settings typical of the RC222 residual current release, the RC223 also allows selection of the maximum threshold of sensitivity to the residual fault frequency (3 steps: 400 – 700 – 1000 Hz). It is therefore possible to adapt the residual current device to the different requirements of the industrial plant according to the prospective fault frequencies generated on the

load side of the release. Typical installations which may require frequency thresholds different from the standard ones (50 – 60 Hz) are the welding plants for the automobile industry (1000 Hz), the textile industry (700 Hz), airports and three-phase drives (400 Hz). All the functions of the apparatus - even the most advanced ones - can be checked by the user by means of a careful watchdog test which is carried out by a series of simple successive steps.

Accessories

Residual current releases

1S0C31017ZF0004

SACE RCQ switchboard residual current relay

The Tmax circuit-breakers can also be combined with the SACE RCQ switchboard relay with separate toroid (to be installed externally on the line conductors) and these fulfil requirements with thresholds up to 30 A trips and times up to 5 s or when the installation conditions are particularly restrictive, such as with circuit-breakers already installed, or limited space in the circuit-breaker compartment. Thanks to the wide range of settings, the SACE RCQ switchboard relay is suitable for applications where a system of residual current protection coordinated with the various distribution levels, from the main switchboard to the end user, is required. It is particularly recommended when low sensitivity residual current protection is required, such as in partial (current) or total (chronometric) selective chains, and for high sensitivity applications (physiological sensitivity) to provide protection of people against direct contacts.

On a drop in the auxiliary power supply voltage, the opening command can intervene after a minimum time of 100 ms and after the time set plus 100 ms.

The SACE RCQ relay is a type A residual current relay and detects residual currents both of the alternating and pulsating type with continuous components.

The SACE RCQ relay is of the type with indirect action and acts on the circuit-breaker release mechanism by means of the shunt opening release of the circuit-breaker itself (to be ordered by the user), to be housed in the special slot made on the left-hand pole of the circuit-breaker.

Accessories

Accessories for electronic releases

1SD0210226F0004

Front display unit - FDU

The front display is a display unit of the setting currents, alarms and parameters of the PR222DS/P and PR222DS/PD electronic releases of T4 and T5. The display unit can operate correctly with self-supply with $I \geq 0.35 \times I_n$ on at least one phase.

If the display is used in combi-

nation with the PR222DS/PD release, and therefore with an auxiliary power supply, it is also possible to detect the protection which has caused the release trip and the fault current. Connection of the display to the PR222DS/PD release must compulsorily pass through the AUX-E auxiliary contacts in elec-

tronic version, whereas with the PR222DS/P release it can be made directly.

It is not compatible with the front accessories: rotary handle operating mechanism, motor operator and front for lever operating mechanism.

1SD0210218F0004

SACE PR010/T test and configuration unit

The SACE PR010/T unit is an instrument able to carry out the Test, programming and parameter readout functions for the protection units which equip the SACE Isomax S and Tmax moulded-case circuit-breakers and the SACE Emax air circuit-breakers.

In particular, for the Tmax T4 and T5 circuit-breakers fitted with PR222DS/P or PD and PR222MP release, the test, programming and readout parameter functions are available.

All the functions mentioned can be carried out ON BOARD by connection of the SACE PR010/T unit to the front multipin connector on the protection unit; connection is guaranteed by means of special interfacing cables supplied as standard with the unit.

The human-machine interface is guaranteed by using a membrane keyboard and a multi-line alphanumeric display.

There are also two LEDs on the unit which signal the following respectively:

- POWER-ON and STAND BY state
- battery charging state.

Two different types of Test are provided: automatic and manual.

By means of connection to the PC (with software provided by ABB SACE), it is also possible to upgrade the software of the SACE PR010/T unit to allow adaptation of the Test unit to evolution of new products.

The most relevant test results can also be stored in the unit itself and sent to the PC on explicit request for "issue of report".

Both in automatic and manual mode, the SACE PR010/T unit is able to test the following:

- protection functions L, S, I, G
- protection functions L, R, I, U with PR222MP

- monitoring of correct operation of the microprocessor.

The SACE PR010/T unit is of the portable type and operates with rechargeable batteries and/or with an external power supply. In its standard supply, the unit includes:

- SACE PR010/T Test unit complete with rechargeable batteries
- SACE TT1 Test unit
- 100...240 V AC/12V DC external power supply
- connection cables between the unit and the multipin connector present on the ranges of releases which equip the Tmax, SACE Isomax S and SACE Emax series
- connection cable between the unit and the PC (serial RS232)
- power supply cable
- instruction manual and floppy with application SW
- plastic bag.

1SD0210350F0004

EP 010 - FBP

It is the "e-plug" interface which can connect T4 and T5, equipped with the PR222DS/PD electronic release, to the field bus plug system, allowing user to choose among several field bus system (ASI, Device Net, Profibus). This must be connected to the release by means of the specific X3 connector.

Accessories

Accessories for electronic releases

1SD2C10379F0004

SACE PR212/CI contactor control unit

The SACE PR212/CI accessory unit can be associated with all the circuit-breakers fitted with the electronic release for motor protection - PR222MP for Tmax and PR212MP for the SACE Isomax S family.

When the special dip switch on the front of the release is positioned on “Normal mode” working mode, it is possible to control contactor opening in the case of a fault due to overload L, blocked rotor R or missing/unbalance of phase U.

The SACE PR212/CI unit can also always be installed either on a DIN rail or on the rear of the door.

1SD2C10327F0004

SACE PR021/K signalling unit

The SACE PR021/K signalling unit can convert the digital signals supplied by the PR222DS/PD (LSI or LSIg) protection unit into electrical signals, via normally open electrical contacts.

The unit is connected to the protection release by means of the Modbus RTU standard serial changeover line, on which all the information about the activation status of the protection functions flows. The corresponding power contacts are closed based on this information.

In particular, the following signals are available:

- the alarm signal remains active throughout the overload, until the release is tripped
- the trip signals of the protections remain active during the timing phase, and even after the release is tripped.

A reset pushbutton allows the state of all the signals to be reset.

The unit also has ten LEDs to visually signal the following information:

- “Power ON”: auxiliary power supply present
- “TX (Int Bus)”: flashing synchronised with dialogue with the internal Bus
- eight LEDs associated with the internal contacts.

The table indicates the characteristics of the signalling relays available in the SACE PR021/K unit.

PR021/K (PR222DS/PD)	
Maximum changeover power (resistive load)	100W / 1250 VA (resistive load)
Maximum changeover voltage	130 V DC / 250 V AC
Maximum changeover current	5 A
Breaking capacity (resistive load) @ 30 V DC	3.3 A
Breaking capacity (resistive load) @ 250 V AC	5 A
Contact/coil insulation	2000 V eff (1 min @ 50 Hz)

Note: the PR021/K unit is an alternative to any supervision and control systems.

SACE TT1 test unit

This allows the PR221DS, PR222DS/P or PD, and PR222MP electronic release trip to be checked and the trip test of the trip coil. The device, supplied by a replaceable 12 V battery, is provided with a connector point with two polarised poles housed on the bottom of the box which allows connection of the device to the test input bushings on the front of the electronic release.

The limited dimensions of the accessory make it practically pocket-type.

CT for external neutral

This is applied to the external neutral conductor and allows protection against earth faults with three-pole circuit breakers.

The circuit breaker must be fitted with PR222DS/P or PD release. The transformer must be connected to the release by means of the specific X4 connectors.

Connectors

Connectors X3 and X4 allow connection of the electronic release with external plant units or components. In fact, they are used to make the L alarm signal available outside, connection of the external neutral, connection to the PR021/K signalling unit, to the PR212/CI contactor control unit or to the temperature sensor of the PTC motor and allows two-way communication from the circuit-breaker fitted with dialogue towards the outside and vice versa. Both the connectors are available both for fixed version circuit-breakers and for plug-in or withdrawable version circuit-breakers.

Automatic transfer switch - ATS010

1SDD210228F0004

Automatic transfer switch - ATS010

The switching unit ATS010 (Automatic Transfer Switch) is the new network-group switching device offered by ABB SACE. It is based on microprocessor technology in compliance with the leading electromagnetic compatibility and environmental standards (EN 50178, EN 50081-2, EN 50082-2, IEC 60068-2-1, IEC 60068-2-2, IEC 60068-2-3).

The device is able to manage the entire switching procedure between the normal line and emergency line circuit breakers automatically, allowing great flexibility of settings.

In case of an error in the normal line voltage, in accordance with the delays set, the normal line circuit breaker is opened, the generator started and the emergency line circuit breaker closed. Similarly, when the normal line returns to range, the reverse switching procedure is automatically controlled. It is especially suited for use in all emergency power supply systems requiring a solution that is ready to install, easy to use and reliable.

Some of the main applications include: power supply for UPS (Uninterrupted Power Supply) units, operating rooms and primary hospital services, emergency power supply for civilian buildings, airports, hotels, data banks and telecommunications systems, power supply of industrial lines for continuous processes.

The switching system consists of the ATS010 unit connected to two motor-driven and mechanically interlocked circuit breakers. Tmax T4 and T5 circuit-breakers and T4D, T5D switch-disconnectors can be used. The built-in mains sensor of the SACE ATS010 device makes it possible to detect errors in the mains voltage. The three inputs may be directly connected to the three phases of the normal power supply line for networks with rated voltage up to 500 V AC. Networks with a higher voltage require the insertion of voltage transformers (TV), setting a rated voltage for the device that matches their secondary voltage (typically 100 V).

Two change-over contacts for each circuit breaker connect directly to the motor operator. The circuit breaker connection is completed by wiring the status contacts: Open/Closed, Relay tripped, Racked-in (for draw out/plug-in circuit-breakers).

That is why on every circuit breaker connected to the ATS010 unit, the following are included in addition to the mechanical interlock accessories:

- motor operator from 48 V to 110 V DC or up to 250 V AC,
- open/closed contact,
- relay tripped contact,
- racked-in contact (for withdrawable versions),
- signal and mechanical lock for protection relay tripped,
- key lock preventing the manual operation of the motor operator.

The ATS010 device is designed to ensure extremely high reliability for the system it controls. It contains various safety systems intrinsically related to software and hardware operation.

For software safety, a special logic prevents unwarranted operations, while a constantly operative watchdog system points out any microprocessor malfunctions via a LED on the front of the device. Hardware safety allows integration of an electrical interlock via power relay, so that there is no need to use an external electrical interlock system. The manual selector on the front of the device can also control the entire switching procedure, even in the event of a microprocessor fault, by working electromechanically on the control relays.

Accessories

Installation and test accessories and spare parts

Bracket for fixing on DIN rail

This is applied to the fixed circuit breaker and allows installation on standardized DIN EN 50022 rails. It simplifies assembly of the T1 - T2 - T3 circuit breakers in standard switchboards.

The bracket for fixing on DIN rail is also available for Tmax circuit breakers combined with RC221 and RC222 residual current releases or with the solenoid operating mechanism of the side-by-side type.

Flange for compartment door

This is always supplied with the Tmax circuit-breakers. All the flanges in the Tmax series are of new design and do not require the use of screws for installation: fixing is greatly simplified by just a simple coupling operation.

When a rotary handle operating mechanism or residual current releases is used, a dedicated flange is supplied to be used instead of the one supplied with the circuit-breaker.

For T4 and T5 withdrawable circuit-breakers, the flange supplied with the conversion kit must be used instead of the one supplied with the fixed circuit-breaker.

Spare parts

The following spare parts are available:

- trip coil for the RC221, RC222 and RC223 residual current releases
- trip coil for the PR221DS electronic release
- kit with washers, screws and plugs for assembly of the front terminals (F).

For further details, please ask the Service Division of ABB SACE for the spare parts catalogue.

Accessories

Compatibility - Internal accessories

Compatibility

An overview of the assembly compatibility of (internal) accessories with the Tmax T1, T2, T3, T4 and T5 circuit-breakers can be found in this section.

Possible combination among the internal accessories

- A = Shunt opening release (SOR) or Undervoltage release (UVR)
- B = Auxiliary contacts
- C = Trip coil of the residual current
- D = Trip coil of the electronic release PR221DS
- E = Auxiliary contacts for T2 with electronic release PR221DS

The drawing represents the internal slot of the circuit-breakers. A and D are housed in the slots on the left of the operating lever, while B, E and F in the right one.

Examples of curve readout

Example 1

Trip curves for distribution (thermo-magnetic release)

Setting the thermomagnetic release. Considering a T4N 250 $I_n = 250$ A circuit-breaker. By means of the thermal adjustment trimmer, the current threshold I_1 is selected, for example at $0.9 \times I_n$ (225 A); the magnetic trip threshold I_3 , adjustable from 5 to $10 \times I_n$, we select at $10 \times I_n$, equal to 2500 A.

It can be noted that, on the basis of the conditions in which the overload is presented, i.e. with the circuit-breaker at thermal running or not, the thermal relay trip varies considerably. For example, for an overload current of $2 \times I_1$, the trip time is between 21.4 and 105.3 s for hot trip, and between 105.3 and 357.8 s for cold trip.

For fault current values higher than 2500 A, the circuit-breaker trips instantaneously with the magnetic protection.

4 Example 2

Current-limiting curves

The following figure shows the trend of the Tmax T2S 160, R160 circuit-breaker current-limiting curves. The r.m.s. of the prospective symmetrical short-circuit current is indicated on the abscissa of the diagram, whereas the peak short-circuit current value is indicated on the ordinates. The current-limiting effect can be assessed by comparing - at the same symmetrical short-circuit current value, the corresponding peak value at the prospective short-circuit current (curve A) with the limited peak value (curve B).

The T2S 160 circuit-breaker with R160 thermomagnetic release at a voltage of 400 V, limits the short-circuit current to 16.2 kA for a fault current of 40 kA, with a reduction of about 68 kA compared with the peak value of the 84 kA prospective short-circuit current.

Example 3

Specific let-through energy curve

An example of reading the graph of the specific let-through energy curve of the T3S 250 R160 circuit-breaker at a voltage of 400 V is given below.

The prospective symmetrical short-circuit current is indicated on the abscissa of the diagram, whereas the ordinates show the specific let-through energy values expressed in $A^2 \cdot s$.

In correspondence with a short-circuit current of 20 kA, the circuit-breaker lets through a value of I^2t equal to $1,17 \cdot 10^6 \cdot A^2 \cdot s$.

Abbreviations used

- I_n = rated current of the thermomagnetic or electronic release
- I_1 = set trip current for overload
- I_3 = trip current for short-circuit
- I_{rms} = prospective symmetrical short-circuit current

Trip curves for motor protection

Use of the trip curves of circuit-breakers with PR222MP electronic release

For correct parameter setting of the PR222MP electronic release, it may be useful to compare the overall circuit-breaker curve with the motor starting curve.

For this purpose, with the protection function graphics shown on the following pages, it is possible to draw the overall curve required for the circuit-breaker fitted with PR222MP release simply and immediately.

N.B. For function L, as for all the other functions, make sure you place a glossy tracing sheet over the curve so that the times on the axis of the co-ordinates coincide.

Function L (cannot be excluded) Protection against overload

To protect the motor against any overloads, as a first step it is necessary to adjust function L to a current I_1 higher than or equal to the rated current of the motor I_e : $I_1 \geq I_e$.

For example, if $I_e = 135$ A, an T4 250 circuit-breaker can be selected with $I_n = 160$ A and the following adjustment carried out: $I_1 = 0.85 \times I_n = 136$ A.

The second step is to select the trip class according to the motor starting time t_a . For a motor with a start-up overload of 6 seconds, class 10 can be selected, with a trip time of 8s at $7.2 \times I_1$.

To trace the curve correctly on the glossy sheet, according to I/I_n , simply place the glossy sheet over the graph of function L so that $I/I_n = 0.85$ (on the glossy sheet) corresponds to $I/I_1 = 1$ (on the graph) and draw the curve relative to class 10.

Function R (can be excluded) Protection against rotor blockage

Protection against rotor blockage can be set both with regard to the trip current $I_5 = 3 \dots 10 \times I_1$ (in this case $I_5 = 3 \dots 10 \times 0.85 \times 160$), and with regard to the trip time t_5 .

To trace the curve correctly on the glossy sheet, simply place the glossy sheet over the graph of function R so that $I/I_n = I_1/I_n$ (on the glossy sheet) corresponds to $I/I_1 = 1$ (on the graph). In this case $I/I_n = I_1/I_n = 0.85$, and draw the desired curve.

Function I (cannot be excluded) Protection against short-circuit

This protection function against short-circuit recognises whether the motor is in the starting phase, thereby avoiding unwarranted trips; the trip threshold can be set from $6 \times I_n$ to $13 \times I_n$.

To trace the curve correctly on the glossy sheet, simply place the glossy sheet over the graph of function I so that $I/I_n = 1$ (on the glossy sheet) corresponds to $I/I_n = 1$ (on the graph) and draw the desired curve.

Function U (can be excluded) Protection against loss and/or unbalance of a phase

Protection against loss or unbalance of a phase, if set to ON, intervenes when one or two phases have a current lower than $0.4 \times I_1$ ($0.4 \times 0.85 \times I_n = 0.4 \times 0.85 \times 160 \text{ A} = 54.4 \text{ A}$ in this case). To trace the curve correctly on the glossy sheet, simply place the glossy sheet over the graph of function U so that $I/I_n = I_1/I_n$ (on the glossy sheet) corresponds to $I/I_1 = 1$ (on the graph). In this case $I/I_n = I_1/I_n = 0.85$, and draw the desired curve.

Curves operating characteristic of an asynchronous motor

Special applications

Use of apparatus at 16 2/3 Hz

The series of thermomagnetic Tmax circuit-breakers are suitable for operation at 16 2/3 Hz frequencies - an application mainly used in the railway sector. The electrical performances are given below (Breaking capacity I_{cu}) according to the voltage and the number of poles to be connected in series with reference to the connection diagrams.

I_{cu} [kA]	Connection diagram	T1			T2				T3		T4					T5

Special applications

Use of apparatus at 16 2/3 Hz

Trip thresholds

The thermal threshold of the circuit-breaker is the same as the normal version.

For the magnetic threshold, a correction coefficient must be used to be made on the protection thresholds as indicated in the table:

Circuit-breaker	Diagram A	Diagram B-C	Diagram D-E-F
T1	1	1	–
T2	0.9	0.9	0.9
T3	0.9	0.9	–
T4	0.9	0.9	0.9
T5	0.9	0.9	0.9

Setting adjustment of the magnetic threshold

The correction factor takes into consideration the phenomena that, with frequencies differing from 50-60 Hz, modifies the tripping value of protection threshold against short circuit. The value that must be set on the release is therefore the real wanted tripping value divided by the correction factor.

Example

- Service current: $I_b = 200$ A
- Circuit-breaker: T4 250 $I_n = 250$ A
- Desired magnetic protection: $I_3 = 2000$ A
- Magnetic threshold value to be set:

$$\text{Set: } \frac{I_3}{k_m}$$

therefore in this specific case, the setting for the adjustment value for the magnetic threshold is:

$$\text{Set: } \frac{2000}{0.9} = 2222 \text{ A (roughly equal to } 9 I_n)$$

Special applications

Use of apparatus at 400 Hz

At high frequencies, performance is reclassified to take into account phenomena such as:

- the increase in the skin effect and the increase in the inductive reactance directly proportional to the frequency cause overheating of the conductors or the copper components in the breaker which normally carry current;
- the lengthening of the hysteresis loop and the reduction of the magnetic saturation value with the consequent variation of the forces associated with the magnetic field at a given current value.

In general, these phenomena have consequences on the behaviour of both the thermomagnetic trip units as well as of the current interrupting parts of the circuit-breaker.

The following tables refer to circuit-breakers with thermomagnetic trip units, with a breaking capacity lower than 36 kA. This value is usually more than sufficient for the protection of installations where such a frequency is used, normally characterized by rather low short-circuit currents.

As can be seen from the data

shown, the tripping threshold of the thermal element (I_1) decreases as the frequency increases because of the reduced conductivity of the materials and of the rise of the associated thermal phenomena; in general, the derating of this performance is generally equal to 10%.

Viceversa, the magnetic threshold (I_3) increases with the increase in frequency: for this reason it is recommended practice to use a 5- I_n version.

In these tables K_m is the multiplier factor of I_3 due to the induced magnetic fields.

Example

Network data:

- rated voltage 400 V AC
- rated frequency 400 Hz
- load current 240 A (I_b)
- current carrying capacity of cable 260 A (I_z)
- short circuit current 32 kA

In order to choose the circuit-breaker suitable for this application, it is necessary to remember the two prescriptions fundamental for the proper use of a circuit-breaker at 400 Hz:

- 10% derating of the thermal protection;
- increase in the magnetic threshold according to the coefficient factor K_m.

In fact, at industrial frequency (50/60 Hz), a circuit-breaker T4N 250 TMA I_n=250 would be suitable for the load current but, being an application at 400 Hz the derating of the thermal protection involves the maximum setting for the trip unit equal to:

$$I_{1 \text{ max } 400 \text{ Hz}} = 250 \cdot \left(\frac{250 \cdot 10}{100} \right) = 225 \text{ A}$$

This value results to be lower than the current of the load; therefore it is necessary to pass to a T4N 320 TMA I_n=320 set at the average value (0.85) which, taking into consideration the derating, corresponds to the following trip threshold:

$$I_{1 \text{ med } 400 \text{ Hz}} = 0,85 \cdot \left[320 - \left(\frac{320 \cdot 10}{100} \right) \right] = 244 \text{ A}$$

This value is higher than the I_b of the load and lower than the cable current carrying capacity I_z.

As far as the magnetic protection I₃ is concerned, as the frequency increases, the setting value of the magnetic trip rises in compliance with the multiplier factor K_m; therefore, it is recommended to have I₃ set at the minimum value of the available settings (5xI_n for a TMA), so as not to have a too high trip value for I₃:

$$I_3 = 5 \cdot I_n \cdot K_m = 5 \cdot 320 \cdot 1,7 = 2720 \text{ A}$$

Special applications

Use of direct current apparatus

To obtain the number of poles in series needed to guarantee the required breaking capacity at the various operating voltages, suitable connection diagrams must be used. For the breaking capacity (I_{cu}), according to the voltage and the number of poles connected in series with reference to the connection diagrams, please refer to the table of pag 4/47.

Protection and isolation of the circuit with three-pole circuit-breakers

Diagram A: Interruption with one pole for polarity.

Note: Without negative polarity connected to earth, the installation method must be such as to make the probability of a second earth fault negligible.

Diagram B: Interruption with two poles in series for one polarity and one pole for the other polarity.

Note: Without negative polarity connected to earth, the installation method must be such as to make the probability of a second earth fault negligible.

Diagram C: Interruption with three poles in series for polarity

Use at 1000 V DC with four-pole circuit-breakers

Diagram D: Interruption with four poles in series for one polarity

Diagram E: Interruption with three poles in series on one polarity and one pole on the other polarity

Note: Without negative polarity connected to earth, the installation method must be such as to make the probability of a second earth fault negligible.

Diagram F: Interruption with two poles in series for polarity

Note: Without negative polarity connected to earth, the installation method must be such as to make the probability of a second earth fault negligible.

Special applications

Use of direct current apparatus

The following table shows which connection diagram to use according to the number of poles to be connected in series to obtain the required breaking capacity, in relation to the type of distribution network:

Distribution system					
Rated voltage [V]	Protection function	Isolation	Earth-insulated network	Network with one polarity ⁽¹⁾ earthed	Network with a middle point earthed
≤ 250	■	■	A	A	A
	■	-	-	-	-
≤ 500	■	■	A	B	A
	■	-	-	C	-
≤ 750	■	■	B	E	F
	■	-	-	C	-
≤ 1000	■	■	E, F	-	F
	■	-	-	D	-

⁽¹⁾ It is presumed that the negative polarity is earthed

Notes:

- 1) The risk of double earth fault is nil, therefore the fault current only involves a part of the interruption poles.
- 2) For rated voltages higher than 750V, the 1000V range for direct current is required.
- 3) For connections with four poles in series, circuit-breakers with neutral at 100% of the phase settings must be used.

In the following table, the correction value to be used for the protection thresholds is indicated for each circuit-breaker against short circuit (the thermal threshold doesn't undergo any alteration).

Circuit-breaker	Diagram A	Diagram B	Diagram C	Diagram D	Diagram E	Diagram F
T1	1.3	1	1	-	-	-
T2	1.3	1.15	1.15	-	-	-
T3	1.3	1.15	1.15	-	-	-
T4	1.3	1.15	1.15	1	1	1
T5	1.1	1	1	0.9	0.9	0.9

400			280÷400	2200÷4400		
500					350÷500	2750÷5500

Special applications

Use of direct current apparatus

Setting adjustment of the magnetic threshold

The correction factor takes into consideration the phenomena that, with direct current applications, modifies the tripping value of protection threshold against short circuit. The value that must be set on the release is therefore the real wanted tripping value divided by the correction factor.

Example

- Service current: $I_b = 550 \text{ A}$
- Circuit-breaker: T5 630 $I_n = 630 \text{ A}$
- Desired magnetic protection: $I_s = 5500 \text{ A}$
- Magnetic threshold value to be set:

$$\text{Set: } \frac{I_s}{k_m}$$

therefore, in this specific case, setting of the adjustment value for the magnetic threshold is:

$$\text{Set: } \frac{5500}{1.1} = 5000 \text{ A (roughly equal to } 8 I_n)$$

Wiring diagrams

Information for reading - Circuit-breakers

State of operation represented

The diagram is shown in the following conditions:

- fixed, plug-in or withdrawable version circuit-breaker (depending on type of circuit-breaker), open and racked-in
- contactor for motor starting open
- circuits de-energised
- releases not tripped
- motor operator with springs charged (for T4 and T5).

Version

The diagram shows a circuit-breaker or switch-disconnector in the plug-in version (only T2, T3, T4 and T5), but is also valid for the fixed and withdrawable version circuit-breakers or switch-disconnectors.

With the fixed version circuit-breakers or switch-disconnectors, the applications indicated in figures 26-27-28-29-30-31 and 32 cannot be provided.

- A17 = Unit for motor electrical latching
- D = Electronic time-delay device of the undervoltage release (outside the circuit-breaker)
- H, H1 = Signalling lamps
- K = Contactor for motor starting
- K51 = Electronic release:
 - PR221DS type overcurrent release, with the following protection functions:
 - L against overload with inverse long time delay
 - S against short-circuit with inverse short time delay
 - I against short-circuit with tempo of instantaneous trip
 - PR222DS/P or PR222DS/PD type overcurrent release, with the following protection functions:
 - L against overload with inverse long time delay
 - S against short-circuit with inverse or definite short time delay
 - I against short-circuit with instantaneous trip time
 - G against earth fault with short time trip
 - PR222MP motor protection type release, with the following protection functions:
 - against overload (thermal protection)
 - against rotor block
 - against short-circuit
 - against missing or unbalanced current between the phases
- K87 = RC221 or RC222 type residual current release
- M = Motor for circuit-breaker opening and circuit-breaker closing spring charging
- M1 = Three-phase asynchronous motor
- Q = Main circuit-breaker
- Q/1...3 = Auxiliary circuit-breaker contacts
- R = Resistor (see note F)
- R1 = Motor thermistor
- R2 = Thermistor in the motor operator
- S1, S2 = Contacts controlled by the cam of the motor operator
- S3 = Contact controlled by the key lock of the solenoid operator or motor operator
- S4/1-2 = Contacts activated by the circuit-breaker rotary handle (see note C)
- K51/1...8 = Contacts for electrical signalling of the protection functions of the electronic release
- S51/S = Contact for electrical signalling of overload in progress

S75I/1...3	= Contacts for electrical signalling of circuit-breaker in racked-in position (only provided with circuit-breakers in plug-in and withdrawable version)
S75IS/1...3	= Contacts for electrical signalling of circuit-breaker in racked-out position (only provided with circuit-breakers in plug-in and withdrawable version)
S87/1	= Contact for electrical signalling of RC222 type residual current release pre-alarm
S87/2	= Contact for electrical signalling of RC222 type residual current release alarm
S87/3	= Contact for electrical signalling of circuit-breaker open due to RC221 or RC222 type residual current release trip
SC	= Pushbutton or contact for closing the circuit-breaker
SC3	= Pushbutton for motor starting
SD	= Switch-disconnector of the power supply of the RC221 or RC222 type residual current release
SO	= Pushbutton or contact for opening the circuit-breaker
SO3	= Pushbutton for stopping the motor
SQ	= Contact for electrical signalling of circuit-breaker open
SY	= Contact for electrical signalling of circuit-breaker open due to YO, YO1, YO2 or YU thermomagnetic release trip (tripped position)
TI	= Toroidal current transformer
TI/L1	= Current transformer placed on phase L1
TI/L2	= Current transformer placed on phase L2
TI/L3	= Current transformer placed on phase L3
TI/N	= Current transformer placed on the neutral
W1	= Serial interface with the control system (EIA RS485 interface. See note D)
X1,X2,X5...X9	= Connectors for the circuit-breaker auxiliary circuits (in the case of circuit-breakers in plug-in version, removal of the connectors takes place simultaneously with that of the circuit-breaker. See note E)
X11	= Back-up terminal box
X3,X4	= Connectors for the circuits of the electronic release (in the case of circuit-breakers in the plug-in version, removal of the connectors takes place simultaneously with that of the circuit-breaker)
XA	= Interfacing connector of the PR222DS/P or PR222DS/PD release
XA1	= Three-way connector for YO/YU (see note E)
XA10	= Three-way connector for solenoid operator
XA2	= Twelve-way connector for auxiliary contacts (see note E)
XA5	= Three-way connector for contact of electrical signalling of circuit-breaker open due to trip of the RC221 or RC222 type residual current release (see note E)
XA6	= Three-way connector for contact of electrical signalling of circuit-breaker open due to trip of the overcurrent release (see note E)
XA7	= Six-way connector for auxiliary contacts (see note E)
XA8	= Six-way connector for contacts operated by the rotary handle or for the motor operator (see note E)
XA9	= Six-way connector for the electrical signalling of RC222 type residual current release pre-alarm and alarm and for opening by means of the release itself (see note E)
XB,XC,XE	= Interfacing connectors of the AUX-E unit
XD	= Interfacing connector of the FDU unit
XF	= Interfacing connector of the MOE-E unit
X0	= Connector for the YO1 trip coil
X01	= Connector for the YO2 trip coil
XV	= Terminal boxes of the applications
YC	= Shunt closing release of the motor operator
YO	= Shunt opening release
YO1	= Trip coil of the electronic release
YO2	= Trip coil of the RC221 or RC222 type residual current release
YU	= Undervoltage release (see note B).

Incompatibility

The circuits indicated by the following figures cannot be supplied at the same time on the same circuit-breaker:

1 - 2 - 3 - 4 - 5 - 6
5 - 6 - 11
10 - 11 - 45
10 - 12
21 - 22 - 23 - 44 - 45 - 46
24 - 25
26 - 32
41 - 42 - 43 - 44 - 45 - 46 - 47 - 48 - 49 - 50 - 51

Notes

- A) The circuit-breaker is only fitted with the applications specified in the ABB SACE order confirmation. To make out the order, please consult this catalogue.
- B) The undervoltage release is supplied for power supply branched on the supply side of the circuit-breaker or from an independent source: circuit-breaker closing is only allowed with the release energised (the lock on closing is made mechanically).
- C) The S4/1 and S4/2 contacts shown in figures 5-6 open the circuit with the circuit-breaker open and close it again when a manual closing command is given by means of the rotary handle, in accordance with the Standards regarding machine tools (in any case, closing does not take place if the undervoltage release is not supplied).
- E) Connectors XA1, XA2, XA5, XA6, XA7, XA8 and XA9 are supplied on request. They are always supplied with T2 and T3 circuit-breakers in the plug-in version.
Connectors X1, X2, X5, X6, X7, X8 and X9 are supplied on request. They are always supplied with circuit-breakers in the plug-in version and with T4 and T5 circuit-breakers in the fixed version.
- F) Additional external resistor for undervoltage release supplied at 380/440 V AC and 480/525 V AC.
- G) In the case of fixed version circuit-breaker with current transformer on external neutral conductor outside the circuit-breaker, when the circuit-breaker is to be removed, it is necessary to short-circuit the terminals of the TI/N transformer.
- H) SQ and SY are opto-insulated contacts.
- I) Instructions for resetting the circuit-breaker tripped by releases
The circuit breaker may be opened by the motor operator (or solenoid operating mechanism). It may also be tripped by the following releases:
- overcurrent trip unit
 - undervoltage release
 - shunt opening release
- with the resultant opening of the SY contact (if provided) connected in series to the M opening motor (or to opening release of solenoid operating mechanism).
In case of tripping, it is necessary to carry out a reset operation through a manual or electrical operation in order to reclose the circuit-breaker. On completion of the resetting operation, the SY contact closes.
The type of reset carried out depends on project requirements and service conditions. We suggest the following resetting types:
- 1) Manual resetting only
Operating electrical control (contact SO1) connected in series to contact SY. Opening is prevented till the circuit-breakers is in tripped position. To reset the circuit-breaker, it is necessary to operate the suitable lever till the circuit-breaker reaches the open position.
 - 2) Electrical reset at operator's responsibility
Normal opening electric control (contact SO1) connected in series to contact SY.
Another opening control (contact SO2) directly connected to the pole 3 of the connector XA8 (or to the pole A11 of the connector XA10) is provided; this must be protected (i.e. key pushbutton) and may only be used if the information sent to the control operator demonstrates that the tripping is not due to a short-circuit or, in the event of a short-circuit, that its cause has been removed.
 - 3) Always admitted electrical reset
The opening electric control (contact SO2) is directly connected to the pole 3 of the connector XA8 (or to the pole A11 of the connector XA10) and then it is always admitted.
Example: resetting of the circuit-breakers after releases tripping.
Notes: In case of overcurrent, it is necessary to find out the causes of the circuit-breaker tripping, in order to prevent a reclosing under short-circuit conditions.
The manual reset is always admitted in any case.

Wiring diagrams

Information for reading - ATS010

State of operation represented

The circuit diagram is for the following conditions:

- circuit-breakers open and racked-in #
- generator not in alarm
- closing springs discharged
- overcurrent relays not tripped *
- ATS010 not powered
- generator in automatic mode and not started
- generator switching enabled
- circuits de-energised
- logic enabled via input provided (terminal 47).

The present diagram shows withdrawable circuit-breakers, but is also valid for fixed circuit-breakers: connect terminal 17 to 20 and terminal 35 to 38 on the ATS010 device.

* The present diagram shows circuit-breakers with overcurrent release (T4-T5), but is also valid for circuit-breakers with thermomagnetic release and to circuit-breakers with out relay (switch-disconnectors): connect terminal 18 to 20 and terminal 35 to 37 of the ATS010 device.

@ The present diagram shows four-pole circuit-breakers but is also valid for two-pole circuit-breakers: use only terminals 26 and 24 (phase and neutral) for the voltage connection of the normal power supply to the ATS010 device; also use the Q61/2 two-pole rather than four-pole auxiliary protection circuit-breaker.

General information

Abbreviations used to describe the apparatus

 F = Front terminals	 EF = Front extended terminals	 ES = Front extended spread terminals
 FC Cu = Front terminals for copper cables	 FC CuAl = Front terminals for Cu/Al cables	 FC CuAl = Front terminals for Cu/Al cables (housed externally)
 R = Rear terminals	 MC = Multi-cable terminals	 HR for RC221/222 = Rear flat horizontal terminals
 HR = Rear flat horizontal terminals	 VR = Rear flat vertical terminals	

 **I₃** = Magnetic trip current [A]

 **I_n** = Rated current of the thermomagnetic release [A]

I_u = Rated uninterrupted current of the circuit-breaker [A]

I_{cu} = Rated ultimate short-circuit breaking capacity [A]

N= 50%
N= 100% = Protection of the neutral at 50% or at 100% of that of the phases [A]

TMF = Thermomagnetic release with fixed thermal and magnetic threshold

TMD = Thermomagnetic release with adjustable thermal and fixed magnetic threshold

TMA = Thermomagnetic release with adjustable thermal and magnetic threshold

TMG = Thermomagnetic release for generator protection

MF = Fixed magnetic only releases

MA = Adjustable magnetic only releases

PR22_ = Electronic releases

Instructions for ordering

Instructions for ordering

Ordering Tmax circuit-breakers fitted with the accessories indicated in the catalogue means that these must be indicated by means of the relative sales codes expressly associated with the circuit-breaker code. The following examples are of particular importance for correctly loading orders for Tmax circuit-breakers fitted with accessories.

1) Terminal Kit for fixed circuit-breaker

To fit the circuit-breaker with different terminal accessories than those supplied on the basic circuit-breaker, it is possible to ask for complete kits (6 or 8 pieces) or half kits (3 or 4 pieces). For conversion of a complete circuit-breaker, it is necessary to specify the complete terminal kit. In the case of a mixed solution, the first code specified indicates the terminals to be mounted at the top, the second indicates the terminals to be mounted at the bottom. On the other hand, when only 3 or 4 pieces are requested, it is important to specify expressly whether the half kit is to be mounted at the top (*) rather than at the bottom (**).

2) T2-T3 electrical accessories on moving part of plug-in circuit-breaker

Fitting the moving parts of plug-in T2-T3 circuit-breakers with SOR, UVR and AUX and with SOR-C, UVR-C and AUX-C accessories always requires the appropriate plug-socket indicated in the catalogue.

a) Tmax T2N 160 moving part of plug-in circuit-breakers with auxiliary contacts

3) T4-T5 electrical accessories on moving part of plug-in circuit-breaker

Fitting the moving parts of plug-in T4-T5 circuit-breakers with SOR, UVR and AUX accessories always requires the appropriate plug-sockets, i.e. in the case of cabled electrical accessories SOR-C, UVR-C, AUX-C, MOE, MOE-E and AUE, the ADP adapters indicated in the catalogue.

a) Tmax T4H 250 moving part of plug-in circuit-breakers with auxiliary contacts

ADP – 6 pin adapter	054922

4) T4-T5 electrical accessories on moving part of withdrawable circuit-breaker

Fitting the moving parts of T4-T5 withdrawable circuit-breakers can only take place using electrical accessories in the pre/cabled version, i.e. SOR-C, UVR-C, AUX-C, MOE, MOE-E and AUE with ADP adapter.

a) Tmax T5V 630 moving part of withdrawable circuit-breaker with UVR-C and MOE

ADP – 10 pin adapter	054924

5) T3 rear mechanical interlock

The rear MIR interlock for T3 allows all the accessories to be used. To be able to receive the circuit-breakers and/or fixed parts mounted directly on the interlocking plate, it is necessary to use the 1SDA050093R1 code to be specified regarding the second circuit-breaker (or fixed part) which is to be interlocked.

Horizontal mechanical interlock made between two T3S 250

		1SDA...R1
POS1	T3S 250 TMD 200 4p FF	051305

	Extra-code for circuit-breaker/fixed part mounted on the interlock	050093

6) T4-T5 mechanical interlock

The rear interlock for T4 and T5, consisting of the MIR-HB or MIR-VB frame unit and the MIR-P plates, allows use of all the front accessories compatible with the circuit-breakers used. To be able to receive the circuit-breakers mounted directly on the interlock plate, code 1SDA050093R1 must be specified regarding the second circuit-breaker (or fixed part) which is to be interlocked.

Horizontal mechanical interlock made between T4H 320 and T5L 630

		1SDA...R1

POS2	T5L 630 PR221DS-LS/I 630 4p F F	054424
	Extra-code for circuit-breaker/fixed part mounted on the interlock	050093

7) PR222DS/PD T4-T5

The T4 and T5 circuit-breakers can be fitted with the PR222DS/PD electronic release, with communication and integrated control functions, using the special extracodes indicated in the catalogue. The circuit-breakers fitted with the PR222DS/PD release can only have the AUX-E electronic version of auxiliary contacts mounted, to communicate the state of the circuit-breaker to the PR222DS/PD, and the MOE-E dedicated stored energy operating mechanism, to remotely control circuit-breaker opening and closing.

MOL-D - different key	054904
MOL-S - same key for different groups of circuit-breakers (N. 20005)	054905
MOL-S - same key for different groups of circuit-breakers (N. 20006)	054906
MOL-S - same key for different groups of circuit-breakers (N. 20007)	054907
MOL-S - same key for different groups of circuit-breakers (N. 20008)	054908
MOL-M - lock only on manual operation with same key	054909

Padlock lever lock - PLL

Type	1SDA.....R1 T1-T2-T3
PLL - plug-in in open position	051393
PLL - for T1 1p - plu-in in open position	060199
PLL - plate in open/closed position	051394
PLL - plate in open position	060534

“Ronis” key lock in open position on the circuit-breaker - KLC ⁽¹⁾

Type	1SDA.....R1 T1-T2-T3
standard version	
KLC keys – the same key for sets of circuit-breakers – T1	053528
KLC keys – the same key for sets of circuit-breakers – T2	053529
KLC keys – the same key for sets of circuit-breakers – T3	053530
version with key removable in both positions	
KLC-S keys – the same key for sets of circuit-breakers – T1	051395
KLC-S keys – the same key for sets of circuit-breakers – T2	052015
KLC-S keys – the same key for sets of circuit-breakers – T3	052016

⁽¹⁾ It cannot be mounted when there is a front operating mechanism, a rotary handle operating mechanism, motor operator, or RC221/RC222 residual current releases and, only in the case of three-pole circuit-breakers, with the service releases (UVR, SOR).

Front for lever operating mechanism - FLD

Type	1SDA.....R1 T4-T5
FLD - for fixed and plug-in	054944
FLD - for withdrawable	054945
FLD - for residual current	055366

Mechanical interlock - MIF

Type	1SDA.....R1 T1-T2-T3
MIF front interlocking plate between 2 circuit-breakers	051396
MIF front interlocking plate between 3 circuit-breakers	052165

Ordering codes

Accessories

Mechanical interlock - MIR

Type	1SDA.....R1	
	T3	T4-T5
MIR-H - rear horizontal mechanical interlock	063324	
MIR-V - rear vertical mechanical interlock	063325	
MIR-HB - frame unit horizontal interlock		054946
MIR-VB - frame unit vertical interlock		054947
MIR-P - plate for type A interlock T4 (F-P-W) + T4 (F-P-W)		054948
MIR-P - plate for type B interlock T4 (F-P-W) + T5 400 (F-P-W) o T5 630 (F)		054949
MIR-P - plate for type C interlock T4 (F-P-W) + T5 630 (P-W)		054950
MIR-P - plate for type D interlock T5 400 (F-P-W) o T5 630 (F) + T5 400 (F-P-W) o T5 630 (F)		054951
MIR-P - plate for type E interlock T5 400 (F-P-W) o T5 630 (F) + T5 630 (P-W)		054952
MIR-P - plate for type F interlock T5 630 (P-W) + T5 630 (P-W)		054953
Extra-code for circuit-breaker/fixated part mounted on the interlock		050093

Note: To interlock two circuit-breakers you have to order a frame unit interlock and a plate (for type A or B or C or D or E or F) interlock.

Sealable lock of thermal adjustment

Type	1SDA.....R1	
	T1-T2-T3	
TMD release anti-adjustment seal	051397	

Lock for fixed part of withdrawable circuit-breaker

Type	1SDA.....R1	
	T4-T5	
KLF-D FP - Different key for each circuit-breaker	055230	
KLF-S FP - Same key for different groups of circuit-breakers	055231	
PLL FP - Lock padlocks	055232	
KLF-D Ronis FP - Lock Ronis type	055233	

Residual current release

SACE RC221, SACE RC222, SACE RC223

Type	1SDA.....R1	
	3 poles	4 poles
RC222/1 MOD 200 mm for T1		053869
RC221/1 for T1	051398	051401
RC222/1 for T1	051400	051402
RC221/2 for T2	051403	051405
RC222/2 for T2	051404	051406
RC221/3 for T3	051407	051409
RC222/3 for T3	051408	051410
RC222/4 for T4 250		054954
RC223/4 for T4 250		054956
RC222/5 for T5		054955

Note: The residual current releases for T2 and T3 circuit-breakers are always supplied complete the with FCCu terminal kit.

SACE RCQ

Type	1SDA.....R1	
	T1...T5	
Relay and closed toroid - diameter 60 mm	037388
